Estimated Population by Sex and Age Group, for Canada and Provinces, 1958

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1958. The method followed in preparing these estimates was as follows:—

To the sex and five-year age group data for Canada and each province as recorded in the 1956 Census are added the final figures of births for the period June, 1956—December, 1957, and registration of births for the period January—May, 1958. The final figures of deaths by sex and age groups for the period May, 1956—December, 1957, were subtracted from the 1956 Census base figures. The registration of deaths for the period January—May, 1958, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1957. Immigration statistics for Canada are available for the whole period, June, 1956—May, 1958, by sex and age groups. The sex and age distribution of immigrants to each province, which is available only as a total figure, is assumed to be the same as for Canada as a whole. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the experience of the intercensal period, 1951-1956. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-56. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the 1961 Census.

Revised estimates by age and sex for the period 1921 to 1956 will be found in Reference Paper No. 40 and Supplement (1952-55).

Population estimative suivant le sexe et par groupe d'âge, Canada et provinces, 1958

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1^{er} juin 1958. La méthode employée dans l'établissement des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, fondées sur les résultats du recensement de 1956, sont ajoutés le chiffre définitif des naissances pour la période de juin 1956 à décembre 1957 et celui des enregistrements de naissances pour la période de janvier—mai 1958. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de mai 1956—décembre 1957 a été soustrait des chiffres de base du recensement de 1956. Les enregistrements de décès pour la période de janvier—mai 1958 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1957. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1956—mai 1958. Il est supposé que la répartition, suivant le sexe et l'âge, des immigrants dans chaque province, dont seul le total est connu, est la même que pour le Canada entier. L'émigration est évaluée d'après des chiffres fournis par les États-Unis et le Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après les chiffres de la période intercensale de 1951-1956. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des émigrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant le plus élevé.

Les chiffres donnés dans ce tableau demeurent sujets à revision lorsque les résultats du recensement de 1961 seront connus.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1956 ont paru dans le Document de référence n° 40 et Supplement (1952-1955).

Estimated Population by Sex and Age Group, for Canada and Provinces, 1959

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1959. The method followed in preparing these estimates was as follows:—

To the sex and five-year age group data for Canada and each province as recorded in the 1956 Census are added the final figures of births for the period June, 1956—December, 1958, and registration of births for the period January—May, 1959. The final figures of deaths by sex and age groups for the period May, 1956—December, 1958, were subtracted from the 1956 Census base figures. The registration of deaths for the period January—May, 1959, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1958. Immigration statistics for Canada are available for the whole period, June, 1956—May, 1959, by sex and age groups. The sex and age distribution of immigrants to each province, which is available only as a total figure, is assumed to be the same as for Canada as a whole. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three-fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-56. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the 1961 Census.

Revised estimates by age and sex for the period 1921 to 1956 will be found in Reference Paper No. 40 and Supplement (1952-55).

Population estimative suivant le sexe et par groupe d'âge, Canada et provinces, 1959

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1^{er} juin 1959. La méthode employée dans l'établissement des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, fondées sur les résultats du recensement de 1956, sont ajoutés le chiffre définitif des naissances pour la période de juin 1956 à décembre 1958 et celui des enregistrements de naissances pour la période de janvier—mai 1959. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de mai 1956—décembre 1958 a été soustrait des chiffres de base du recensement de 1956. Les enregistrements de décès pour la période de janvier—mai 1959 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1958. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1956—mai 1959. Il est supposé que la répartition, suivant le sexe et l'âge, des immigrants dans chaque province, dont seul le total est connu, est la même que pour le Canada entier. L'émigration est évaluée d'après des chiffres fournis par les États-Unis et le Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition par sexe et par âge des émigrations vers les États-Unis, qui représentent les trois-cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des émigrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant le plus élevé.

Les chiffres donnés dans ce tableau demeurent sujets à revision lorsque les résultats du recensement de 1961 seront connus.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1956 ont paru dans le Document de référence n° 40 et Supplément (1952-1955).

**Estimated Population by Sex and Age Group,
for Canada and Provinces, 1960**

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1960. The method followed in preparing these estimates was as follows:—

To the sex and five-year age group data for Canada and each province as recorded in the 1956 Census were added the final figures of births for the period June, 1956—December, 1959, and registration of births for the period January—May, 1960. The final figures of deaths by sex and age groups for the period May, 1956—December, 1959, were subtracted from the 1956 Census base figures. The registration of deaths for the period January—May, 1960, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1959. Immigration statistics for Canada are available for the whole period, June, 1956—May, 1960, by sex and age groups. The sex and age distribution of immigrants to each province, available since 1958 from the Department of Citizenship and Immigration, were used. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three-fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-1956. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the 1961 Census.

Revised estimates by age and sex for the period 1921 to 1956 will be found in Reference Paper No. 40 and Supplement (1952-1955).

**Population estimative suivant le sexe et par groupe
d'âge, Canada et provinces, 1960**

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1960. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1956, sont ajoutés le chiffre définitif des naissances pour la période de juin 1956 à décembre 1959 et celui des enregistrements de naissances pour la période de janvier—mai 1960. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de mai 1956—décembre 1959 a été soustrait des chiffres de base du recensement de 1956. Les enregistrements de décès pour la période de janvier—mai 1960 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1959. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1956—mai 1960. La répartition (sexe et âge) des immigrants dans chaque province, établie par le ministère de la Citoyenneté et de l'Immigration depuis 1958, a été utilisée. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois-cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du recensement de 1961.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1956 ont paru dans le Document de référence n° 40 et Supplément (1952-1955).

**Estimated Population by Sex and Age Group,
for Canada and Provinces, (1962)**

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1962. The method followed in preparing these estimates was as follows:—

To the sex and five-year age group data for Canada and each province as recorded in the 1961 Census were added the final figures of births for the period June, 1961—December, 1961, and registration of births for the period January—May, 1962. The final figures of deaths by sex and age groups for the period June, 1961—December, 1961, were subtracted from the 1961 Census base figures. The registration of deaths for the period January—May, 1962, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1961. Immigration statistics for Canada are available for the whole period, June, 1961—May, 1962, by sex and age groups. The sex and age distribution of immigrants to each province, available since 1958 from the Department of Citizenship and Immigration, were used. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three-fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-1956. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the next Census.

Revised estimates by age and sex for the period 1921 to 1961 will be found in Reference Paper No. 40 and Supplement (1952-1961).

**Population estimative suivant le sexe et par groupe
d'âge, Canada et provinces, 1962**

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1962. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1961, sont ajoutés le chiffre définitif des naissances pour la période de juin 1961 à décembre 1961 et celui des enregistrements de naissances pour la période de janvier—mai 1962. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de juin 1961—décembre 1961 a été soustrait des chiffres de base du recensement de 1961. Les enregistrements de décès pour la période de janvier—mai 1962 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1961. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1961—mai 1962. La répartition (sexe et âge) des immigrants dans chaque province, établie par le ministère de la Citoyenneté et de l'Immigration depuis 1958, a été utilisée. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois-cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant.

Les chiffres donnés dans ce tableau sont sujets à revision à la lumière du prochain recensement.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1961 ont paru dans le Document de référence n° 40 et Supplément (1952-1961).

**Estimated Population by Sex and Age Group,
for Canada and Provinces, (1963)**

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1963. The method followed in preparing these estimates was as follows:—

To the sex and five-year age group data for Canada and each province as recorded in the 1961 Census were added the final figures of births for the period June, 1961—December, 1962, and registration of births for the period January—May, 1963. The final figures of deaths by sex and age groups for the period June, 1961—December, 1962, were subtracted from the 1961 Census base figures. The registration of deaths for the period January—May, 1963, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1962. Immigration statistics for Canada are available for the whole period, June, 1961—May, 1963, by sex and age groups. The sex and age distribution of immigrants to each province, available since 1958 from the Department of Citizenship and Immigration, were used. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three-fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-1956. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the next Census.

Revised estimates by age and sex for the period 1921 to 1961 will be found in Reference Paper No. 40 and Supplement (1952-1961).

**Population estimative suivant le sexe et par groupe
d'âge, Canada et provinces, 1963**

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1963. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1961, sont ajoutés le chiffre définitif des naissances pour la période de juin 1961 à décembre 1962 et celui des enregistrements de naissances pour la période de janvier—mai 1963. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de juin 1961—décembre 1962 a été soustrait des chiffres de base du recensement de 1961. Les enregistrements de décès pour la période de janvier—mai 1963 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1962. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1961—mai 1963. La répartition (sexe et âge) des immigrants dans chaque province, établie par le ministère de la Citoyenneté et de l'Immigration depuis 1958, a été utilisée. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois-cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant.

Les chiffres donnés dans ce tableau sont sujets à revision à la lumière du prochain recensement.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1961 ont paru dans le Document de référence n° 40 et Supplément (1952-1961).

**Estimated Population by Sex and Age Group,
for Canada and Provinces, 1964**

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1964. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1961 Census were added the final figures of births for the period June, 1961-December, 1963 and registration of births for the period January-May, 1964. The final figures of deaths by sex and age groups for the period June, 1961-December, 1963 were subtracted from the 1961 Census base figures. The registration of deaths for the period January-May, 1964, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1963. Immigration statistics for Canada are available for the whole period, June, 1961-May, 1964, by sex and age groups. The sex and age distribution of immigrants to each province, available since 1958 from the Department of Citizenship and Immigration, were used. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1951-1956. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the next Census.

Revised estimates by age and sex for the period 1921 to 1961 will be found in Reference Paper No. 40 and Supplement (1952-1961).

**Population estimative suivant le sexe et par groupe
d'âge, Canada et provinces, 1964**

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1964. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1961, sont ajoutés le chiffre définitif des naissances pour la période de juin 1961 à décembre 1963 et celui des enregistrements de naissances pour la période de janvier-mai 1964. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de juin 1961-décembre 1963 a été soustrait des chiffres de base du recensement de 1961. Les enregistrements de décès pour la période de janvier-mai 1964 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1963. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1961-mai 1964. La répartition (sexe et âge) des immigrants dans chaque province, établie par le ministre de la Citoyenneté et de l'Immigration depuis 1958, a été utilisée. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1951-1956. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant.

Les chiffres donnés dans ce tableau sont sujets à revision à la lumière du prochain recensement.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1961 ont paru dans le Document de référence n° 40 et Supplément (1952-1961).

ESTIMATED POPULATION BY SEX AND AGE GROUP,
FOR CANADA AND PROVINCES, 1965 as of June 1.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE
D'ÂGE, CANADA ET PROVINCES, 1965

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1965. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1961 Census were added the final figures of births for the period June 1961 - December 1964 and registration of births for the period January - May 1965. The final figures of deaths by sex and age groups for the period June 1961 - December 1964 were subtracted from the 1961 Census base figures. The registration of deaths for the period January - May 1965, were distributed by sex and age groups in the same proportions as the deaths in Canada for the year 1964. Immigration statistics for Canada are available for the whole period, June 1961 - May 1965, by sex and age groups. The sex and age distribution of immigrants to each province, available since 1958 from the Department of Citizenship and Immigration, were used. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age group is estimated according to the sex and age group of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, from the estimated population of the previous year graduated to single years of age, the population at the oldest age in each five-year age group was calculated and moved on to the next higher age group.

The figures presented in this statement are subject to revision following the next Census.

Revised estimates by age and sex for the period 1921 to 1961 will be found in Reference Paper No. 40 and Supplement (1952-1961).

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1965. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1961, sont ajoutés le chiffre définitif des naissances pour la période de juin 1961 à décembre 1964 et celui des enregistrements de naissances pour la période de janvier - mai 1965. Le chiffre définitif des décès suivant le sexe et par groupe d'âge pour la période de juin 1961 - décembre 1964 a été soustrait des chiffres de base du recensement de 1961. Les enregistrements de décès pour la période de janvier - mai 1965 ont été répartis suivant le sexe et par groupe d'âge dans les mêmes proportions que les décès au Canada en 1964. Les statistiques de l'immigration, pour le Canada, sont connues, suivant le sexe et par groupe d'âge, pour la période entière de juin 1961 - mai 1965. La répartition (sexe et âge) des immigrants dans chaque province, établie par le ministère de la Citoyenneté et de l'Immigration depuis 1958, a été utilisée. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et par groupe d'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956-1961. Finalement, d'après la population estimative de l'année précédente, ramenée à chaque année d'âge, on calcule la population d'âge le plus avancé de chaque groupe quinquennal d'âge et on la reporte au groupe d'âge suivant.

Les chiffres donnés dans ce tableau sont sujets à revision à la lumière du prochain recensement.

Les estimations révisées suivant l'âge et le sexe pour la période de 1921 à 1961 ont paru dans le Document de référence n° 40 et Supplément (1952-1961).

ESTIMATED POPULATION BY SEX AND AGE GROUP,
FOR CANADA AND PROVINCES, 1967POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE
D'ÂGE, CANADA ET PROVINCES, 1967

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1967. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1966 Census, and graduated to single years of age, were added the final figures of births for the period June - December 1966 and registration of births for the period January - May 1967. The final figures of deaths by sex and age for the period June - December 1966 together with the registration of deaths for the period January - May 1967 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1966) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Manpower and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and totalled into five-year age groups.

The figures presented in this statement are subject to revision following the next Census.

Revised estimates by age and sex for the period 1962 to 1965 are being prepared and together with similar data for each year back to 1921 will be published early in 1968.

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1967. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1966, et réparties par année d'âge, sont ajoutés le chiffre définitif des naissances pour la période de juin à décembre 1966 et celui des enregistrements de naissances pour la période de janvier - mai 1967. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin à décembre 1966, ainsi que les enregistrements de décès pour la période de janvier - mai 1967 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1966) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'œuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Les estimations révisées, suivant l'âge et le sexe pour la période de 1962 à 1965, ainsi que des données semblables pour chaque année depuis 1921, sont en voie de préparation et seront publiées au début de 1968.

ESTIMATED POPULATION BY SEX AND AGE GROUP, FOR CANADA AND PROVINCES, JUNE 1, 1968

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1968. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1966 Census, and graduated to single years of age, were added the final figures of births for the period June 1966 - December 1967 and registration of births for the period January - May 1968. The final figures of deaths by sex and age for the period June 1966 - December 1967 together with the registration of deaths for the period January - May 1968 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1967) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Manpower and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and tailed into five-year age groups.

The figures presented in this statement are subject to revision following the next census.

Similar data for previous years are available in a bulletin published in June 1968: Population 1921-1966, Revised Annual Estimates of Population by Sex and Age, Canada and the Provinces; Catalogue No. 91-511, price 75 cents.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE D'ÂGE, CANADA ET PROVINCES, 1er JUIN 1968

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1968. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1966, et réparties par année d'âge, sont ajoutés le chiffre définitif des naissances pour la période de juin 1966 à décembre 1967 et celui des enregistrements de naissances pour la période de janvier - mai 1968. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin 1966 à décembre 1967, ainsi que les enregistrements de décès pour la période de janvier - mai 1968 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1967) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'œuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Des données semblables pour les années antérieures sont disponibles dans un bulletin publié en juin 1968: Population 1921-1966, Révision des estimations annuelles de la population par sexe et par groupe d'âge, Canada et provinces; numéro de catalogue 91-511, prix 75 cents.

ESTIMATED POPULATION BY SEX AND AGE GROUP, FOR CANADA AND PROVINCES, JUNE 1, 1969

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1969. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1966 Census, and graduated to single years of age, were added the final figures of births for the period June 1966 - December 1968 and registration of births for the period January - May 1969. The final figures of deaths by sex and age for the period June 1966 - December 1968 together with the registration of deaths for the period January - May 1969 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1968) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Manpower and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and tallied into five-year age groups.

The figures presented in this statement are subject to revision following the next census.

Similar data for previous years are available in a bulletin published in June 1968: Population 1921-1966, Revised Annual Estimates of Population by Sex and Age, Canada and the Provinces; Catalogue No. 91-511, price 75 cents.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE D'ÂGE, CANADA ET PROVINCES, 1er JUIN 1969

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1969. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1966, et réparties par année d'âge, sont ajoutés le chiffre définitif des naissances pour la période de juin 1966 à décembre 1968 et celui des enregistrements de naissances pour la période de janvier - mai 1969. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin 1966 à décembre 1968, ainsi que les enregistrements de décès pour la période de janvier - mai 1969 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1968) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'oeuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Des données semblables pour les années antérieures sont disponibles dans un bulletin publié en juin 1968: Population 1921-1966, Revision des estimations annuelles de la population par sexe et par groupe d'âge, Canada et provinces; numéro de catalogue 91-511, prix 75 cents.

ESTIMATED POPULATION BY SEX AND AGE GROUP, FOR CANADA AND PROVINCES (JUNE 1, 1970)

as of June 1,

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1970. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1966 Census, and graduated to single years of age, were added the final figures of births for the period June 1966 - December 1969 and registration of births for the period January - May 1970. The final figures of deaths by sex and age for the period June 1966 - December 1969 together with the registration of deaths for the period January - May 1970 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1969) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Manpower and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and tallied into five-year age groups.

The figures presented in this statement are subject to revision following the next census.

Similar data for previous years are available in a bulletin published in June 1968: Population 1921-1966, Revised Annual Estimates of Population by Sex and Age, Canada and the Provinces; Catalogue No. 91-511, price 75 cents.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE D'ÂGE, CANADA ET PROVINCES, 1er JUIN 1970

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1er juin 1970. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1966, et réparties par année d'âge, sont ajoutés le chiffre définitif des naissances pour la période de juin 1966 à décembre 1969 et celui des enregistrements de naissances pour la période de janvier - mai 1970. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin 1966 à décembre 1969, ainsi que les enregistrements de décès pour la période de janvier - mai 1970 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1969) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'œuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Des données semblables pour les années antérieures sont disponibles dans un bulletin publié en juin 1968: Population 1921-1966, Révision des estimations annuelles de la population par sexe et par groupe d'âge, Canada et provinces; numéro de catalogue 91-511, prix 75 cents.

ESTIMATED POPULATION BY SEX AND AGE GROUP,

FOR CANADA AND PROVINCES (JUNE 1, 1972) ... as on June 1,

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1972. The method followed in preparing these estimates was as follows:

To the sex and five-year age group data for Canada and each province as recorded in the 1971 Census, and graduated to single years of age, were added the final figures of births for the period June 1971 – December 1971 and registration of births for the period January – May 1972. The final figures of deaths by sex and age for the period June 1971 – December 1971 together with the registration of deaths for the period January – May 1972 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1971) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Manpower and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about three fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and totalled into five-year age groups.

The figures presented in this statement are subject to revision following the next census.

Similar data for the years 1921 to 1971 will be available in the bulletin: Population 1921-1971, Revised Annual Estimates of Population by Sex and Ages, Canada and the Provinces; Catalogue No. 91-512, price 75 cents. This bulletin will be published by the spring of 1973.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE

D'ÂGE, CANADA ET PROVINCES, 1^{er} JUIN 1972

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1^{er} juin 1972. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et par groupe quinquennal d'âge pour le Canada et les provinces, d'après le recensement de 1971, et réparties par année d'âge, sont ajoutés le chiffre définitif des naissances pour la période de juin 1971 à décembre 1971 et celui des enregistrements de naissances pour la période de janvier – mai 1972. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin 1971 à décembre 1971, ainsi que les enregistrements de décès pour la période de janvier – mai 1972 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1971) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'œuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les trois cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Des données semblables seront disponibles pour les années 1921 à 1971 dans le bulletin: Population 1921-1971, Révision des estimations annuelles de la population par sexe et par groupe d'âge, Canada et provinces, numéro de catalogue 91-512; prix 75 cents. Ce bulletin sera publié au printemps 1973.

ESTIMATED POPULATION BY SEX AND AGE GROUP, FOR CANADA AND PROVINCES, JUNE 1, 1973

The following table gives estimates of the population of Canada and the provinces by age and sex as of June 1, 1973. The method followed in preparing these estimates was as follows:

To the sex and single-year age data for Canada and each province as recorded in the 1971 Census were added the final figures of births for the period June 1971 - December 1972 and registration of births for the period January - May 1973. The final figures of deaths by sex and age for the period June 1971 - December 1972 together with the registration of deaths for the period January - May 1973 (distributed by sex and age in the same proportions as the deaths in Canada for the year 1972) were subtracted from the basic data. Immigration statistics for Canada and the provinces are available from the Department of Man-power and Immigration for the whole period by sex and five-year age groups. These were graduated to single years. Emigration is estimated from data supplied by the United States and the United Kingdom on immigrants to those countries from Canada and an allowance made for emigration to other countries. Emigration from each province by sex and age is estimated according to the sex and age of emigrants to the United States, who constitute about two fifths of all emigrants. The estimate of interprovincial migration by age and sex was based on Family Allowance data and on the estimated age distribution of interprovincial migrants over the intercensal period, 1956-1961. Finally, the estimated population at each year of age was moved on to the next higher age and totalled into five-year age groups.

The figures presented in this statement are subject to revision following the next census.

Similar data for the years 1921 to 1971 are available in the bulletin: Population 1921-1971, Revised Annual Estimates of Population by Sex and Age Group, Canada and the Provinces; Catalogue No. 91-512, price 75 cents.

POPULATION ESTIMATIVE SUIVANT LE SEXE ET PAR GROUPE D'ÂGE, CANADA ET PROVINCES, 1^{ER} JUIN 1973

Le tableau qui suit donne la population estimative du Canada et des provinces, suivant le sexe et par groupe d'âge, au 1^{er} juin 1973. La méthode de calcul des estimations est la suivante:

Aux données suivant le sexe et les années d'âge pour le Canada et les provinces d'après le recensement de 1971 sont ajoutés le chiffre définitif des naissances pour la période de juin 1971 à décembre 1972 et celui des enregistrements de naissances pour la période de janvier - mai 1973. Le chiffre définitif des décès suivant le sexe et l'âge pour la période de juin 1971 à décembre 1972, ainsi que les enregistrements de décès pour la période de janvier - mai 1973 (répartis suivant le sexe et l'âge dans les mêmes proportions que les décès au Canada en 1972) ont été soustraits des chiffres de base. Les statistiques de l'immigration pour le Canada et les provinces peuvent être obtenues du ministère de la Main-d'oeuvre et de l'Immigration pour la période entière suivant le sexe, et par groupe quinquennal d'âge réparti par année d'âge. L'émigration est évaluée d'après les chiffres des États-Unis et du Royaume-Uni sur les immigrants venus du Canada dans ces pays, après avoir fait la part de l'émigration vers d'autres pays. L'émigration de chacune des provinces, suivant le sexe et l'âge, est évaluée d'après la répartition (sexe et âge) des émigrants vers les États-Unis, qui représentent les deux cinquièmes environ de tous les émigrants. Les migrations interprovinciales suivant le sexe et l'âge sont fondées sur les données relatives aux allocations familiales et sur la répartition estimative par âge des migrants interprovinciaux durant la période intercensale de 1956 à 1961. Finalement, la population estimative, à chaque année d'âge, a été reportée à l'âge suivant et calculée par groupe quinquennal d'âge.

Les chiffres donnés dans ce tableau sont sujets à révision à la lumière du prochain recensement.

Des données semblables sont disponibles pour les années 1921 à 1971 dans le bulletin: Population 1921-1971, Révision des estimations annuelles de la population par sexe et par groupe d'âge, Canada et provinces, numéro de catalogue 91-512, prix 75 cents.

POPULATION OF CANADA AND THE PROVINCES BY SEX AND AGE GROUP, ESTIMATED AS OF JUNE 1, 1974

The table on page 2 shows the population of Canada and the provinces by sex and age group as of June 1, 1974. In producing these estimates the component method has been used, that is, the number of births and total net migration (internal and international) have been added to the population figures by single years of age for June 1, 1973, while the number of deaths was deducted from the total.

The distribution for deaths by sex and single years of age is that observed for the 1973 calendar year. The data on immigration by sex and age were provided by the Department of Manpower and Immigration. Estimates of the volume of emigration from Canada were obtained by adding to the data on the number of former residents of Canada who migrated to the United States and the United Kingdom the estimated volume of emigration to all other countries. These estimates of emigration were then distributed by sex and age group according to the distribution observed among Canadian emigrants to the United States. The estimates of net interprovincial migration are based on notification of change of address of Family Allowance recipients. These interprovincial migration estimates were distributed by sex on the basis of the distribution observed for the 1966-71 intercensal period, and these were further distributed by five-year age groups according to the 1972-73 age distribution. In addition, Sprague's multipliers were used to obtain the single year of age distribution of emigrants and interprovincial migrants.

These post-censal estimates will be revised when the 1976 Census data become available.

Similar estimates for previous years are available in the Statistics Canada bulletin entitled Population 1921-71 - Revised Annual Estimates of Population by Sex and Age Group, Canada and Provinces (Catalogue No. 91-512), price 75 cents. Estimates by single years of age since 1971 are also available upon request. Inquiries should be directed to Population Estimates and Projections Division, Census Field, Statistics Canada, Ottawa, K1S 5A4.

POPULATION DU CANADA ET DES PROVINCES SELON LE SEXE ET PAR GROUPE D'ÂGES, ESTIMÉE AU 1^{er} JUIN 1974

On trouvera dans le tableau de la page 2 la population du Canada et des provinces selon le sexe et le groupe d'âges au 1^{er} juin 1974. Pour produire ces estimations on s'est servi de la méthode des composantes: aux effectifs du 1^{er} juin 1973 par année d'âge, on a ajouté le nombre des naissances, le solde migratoire externe et interne, et retranché le nombre des décès.

La répartition des décès selon le sexe et l'année d'âge est celle observée durant l'année civile 1973. Les statistiques de l'immigration selon le sexe et l'âge sont fournies par le ministère de la Main-d'œuvre et de l'Immigration. Pour le calcul des émigrants on a utilisé deux sources: premièrement, le nombre d'immigrants entrés aux États-Unis et au Royaume-Uni dont le pays de résidence antérieur était le Canada, deuxièmement, une estimation des effectifs d'émigrants vers les autres pays. Ces effectifs ont ensuite été répartis par sexe et par groupe d'âges dans des proportions identiques à celles observées chez les émigrants canadiens aux États-Unis. Le solde migratoire interne résulte d'une estimation fondée sur les changements d'adresse des bénéficiaires des allocations familiales. Les effectifs de migrants interprovinciaux de chaque sexe ont été établis à partir de la répartition observée au cours de la période intercensitaire 1966-1971 puis distribués par groupe d'âges de cinq ans selon la répartition de 1972-1973. Quant à la distribution par année d'âge des migrants interprovinciaux et des émigrants, elle a été obtenue à l'aide des multiplicateurs de Sprague.

Ces estimations postcensitaires seront révisées à la lumière des données du recensement de 1976.

On trouvera des estimations similaires pour les années antérieures dans la publication de Statistique Canada intitulée Population 1921-1971 - Révision des estimations annuelles de la population par sexe et par groupe d'âges, Canada et provinces, numéro au catalogue 91-512, prix 75 cents. On peut aussi obtenir les estimations par année d'âge depuis 1971 en s'adressant à la Division des estimations et des projections démographiques, Secteur du recensement, Statistique Canada, Ottawa, K1S 5A4.

POPULATION OF CANADA AND THE PROVINCES BY SEX AND AGE GROUP, ESTIMATED AS OF JUNE 1, 1975

The table on page 2 shows the population of Canada and the provinces by sex and age group as of June 1, 1975. In producing these estimates the component method has been used, that is, the number of births and total net migration (internal and international) have been added to the population figures by single years of age for June 1, 1974, while the number of deaths was deducted from the total.

The distribution for deaths by sex and single years of age is that observed for the 1973 calendar year. The data on immigration by sex and age were provided by the Department of Manpower and Immigration. Estimates of the volume of emigration from Canada were obtained by adding to the data on the number of former residents of Canada who migrated to the United States and the United Kingdom the estimated volume of migration to all other countries. These estimates of emigration were apportioned by sex and age group according to the distribution observed among Canadian emigrants to the United States and were then distributed by single years of age using Sprague's multipliers. The estimates of net internal migration are based on change of address notifications of Family Allowance recipients. These internal migration estimates were apportioned by sex and by single years of age on the basis of migration data obtained in the 1971 Census.

These post-censal estimates will be revised when the 1976 Census data become available.

Similar estimates for previous years are available in the Statistics Canada bulletin entitled Population 1921-71 - Revised Annual Estimates of Population by Sex and Age Group, Canada and Provinces (Catalogue 91-512), price 75 cents. Estimates by single years of age since 1971 are also available upon request. Inquiries should be directed to Population Estimates and Projections Division, Census Field, Statistics Canada, Ottawa, K1S 5A4.

POPULATION DU CANADA ET DES PROVINCES SELON LE SEXE ET PAR GROUPE D'ÂGES, ESTIMÉE AU 1^{er} JUIN 1975

On trouvera dans le tableau de la page 2 la population du Canada et des provinces selon le sexe et le groupe d'âges au 1^{er} juin 1975. Pour produire ces estimations on s'est servi de la méthode des composantes: aux effectifs du 1^{er} juin 1974 par année d'âge, on a ajouté le nombre des naissances, le solde migratoire externe et interne, et retranché le nombre des décès.

La répartition des décès selon le sexe et l'année d'âge est celle observée durant l'année civile 1973. Les statistiques de l'immigration selon le sexe et l'âge sont fournies par le ministère de la Main-d'œuvre et de l'Immigration. Pour le calcul des émigrants on a utilisé deux sources: premièrement, le nombre d'immigrants entrés aux États-Unis et au Royaume-Uni dont le pays de résidence antérieur était le Canada, deuxièmement, une estimation des effectifs d'émigrants vers les autres pays. Ces effectifs ont été répartis par sexe et par groupe d'âges dans des proportions identiques à celles observées chez les émigrants canadiens aux États-Unis puis distribués par année d'âge à l'aide des multiplicateurs de Sprague. Le solde migratoire interne résulte d'une estimation fondée sur les changements d'adresse des bénéficiaires des allocations familiales. La répartition de ce solde par année d'âge et selon le sexe repose sur les données de la migration recueillies au recensement de 1971.

Ces estimations postcensitaires seront révisées à la lumière des données du recensement de 1976.

On trouvera des estimations similaires pour les années antérieures dans la publication de Statistique Canada intitulée Population 1921-71 - Révision des estimations annuelles de la population par sexe et par groupe d'âges, Canada et provinces, n° 91-512 au catalogue, prix 75 cents. On peut aussi obtenir les estimations par année d'âge depuis 1971 en s'adressant à la Division des estimations et des projections démographiques, Secteur du recensement, Statistique Canada, Ottawa, K1S 5A4.

INTRODUCTION

For years other than census years, Statistics Canada publishes regularly postcensal estimates of the total population by age and sex as of June 1, which are calculated on the basis of the results of the preceding census.

This bulletin contains the age and sex breakdown of the preliminary postcensal estimates of the total population as of June 1, 1977, previously published in Catalogue 91-201 (November 1977). The corresponding data from the 1976 Census have also been included here for purposes of comparison.

It should be noted that, in the past, Statistics Canada published only one series of postcensal estimates by age and sex. Beginning with June 1, 1977, two series of postcensal estimates will be published: preliminary postcensal estimates and final postcensal estimates. The latter series, which will constitute an updating of the preliminary estimates, will be published when more recent data on components become available. Moreover, the final postcensal estimates will be revised at a later date in light of the results of the 1981 Census in order to provide intercensal estimates (formerly called "revised estimates") of the population by age and sex. Catalogue 91-512 Occasional (July 1973) and Catalogue 91-518 Occasional (forthcoming) contain these intercensal estimates for the periods 1921-1971 and 1971-1976 respectively.

METHODOLOGY

The preliminary estimates contained herein were obtained by the component method, using the 1976 Census counts as the base population.

The demographic events experienced by each cohort, defined here as the total number of persons born during a given census year; in this case, the 12-month period commencing June 1, 1976 were compiled as follows: (the June 1, 1976 population count + total immigrants) - (total deaths + total emigrants). The same mathematical procedure is applied to individuals born during the period of June 1, 1976 to May 31, 1977, who will therefore have lived less than one complete year by June 1, 1977. It is also necessary to add the interprovincial net migration experienced by each province; obviously, the net migration gains and losses sum to zero at the national level. This produces a preliminary postcensal estimate for each age or age group and each sex as of June 1, 1977.

Sauf pour les années de recensement, Statistique Canada publie régulièrement des estimations postcensitaires de la population selon le sexe et l'âge au 1^{er} juin, calculées à partir des résultats du dernier recensement.

Ce bulletin présente les estimations postcensitaires provisoires de la population selon le sexe et l'âge au 1^{er} juin 1977 qui constituent une ventilation des estimations postcensitaires provisoires de la population totale à la même date, déjà publiées dans le n^o 91-201 au catalogue (novembre 1977). Afin de faciliter les comparaisons, les effectifs correspondants recensés le 1^{er} juin 1976 ont également été reproduits ici.

Il faut noter que, dans le passé, Statistique Canada ne publiait qu'une série d'estimations postcensitaires selon le sexe et l'âge. À compter du 1^{er} juin 1977, on disposera de deux séries d'estimations postcensitaires publiées: les estimations postcensitaires provisoires et les postcensitaires finales. Les secondes constitueront une mise à jour des premières, au fur et à mesure que des données plus récentes sur les composantes deviendront disponibles; de plus, ces estimations finales seront révisées à la lumière des résultats du recensement de 1981 pour donner lieu à des estimations intercensitaires (anciennement "estimations révisées") de la population selon le sexe et l'âge. Les publications hors série nos 91-512 (juillet 1973) et 91-518 (à paraître) au catalogue présentent ces estimations intercensitaires pour les périodes 1921-1971 et 1971-1976 respectivement.

MÉTHODOLOGIE

Ces estimations provisoires, obtenues par la méthode des composantes, ont comme point de départ les résultats du recensement de 1976.

Ainsi, pour chaque génération - définie ici comme l'ensemble des personnes nées au cours d'une même année censitaire - on a tenu compte des événements démographiques survenus durant la période de 12 mois commençant le 1^{er} juin 1976. À l'effectif recensé à cette date on a donc ajouté le nombre des immigrants, puis on en a retranché le nombre des décès et des émigrants. La même comptabilité est appliquée aux individus nés durant la période du 1^{er} juin 1976 au 31 mai 1977 et qui auront donc moins de un an le 1^{er} juin 1977. Pour chaque province, il faut en outre ajouter le solde migratoire interprovincial, celui-ci étant évidemment nul au niveau national. On aboutit ainsi, pour chaque âge ou groupe d'âges et chacun des sexes, à une estimation postcensitaire provisoire au 1^{er} juin 1977.

DATA SOURCES

The components of population change are estimated on the basis of data gleaned from the various sources listed below:

(a) Immigration

Data on the number of immigrants are supplied by Employment and Immigration Canada (formerly the Department of Manpower and Immigration); the breakdown by province refers to the intended province of destination as specified by the immigrant at the time of his arrival.

These statistics have been assembled according to the year of birth for the following immigration periods: January-December 1976, January-May 1976 and January-May 1977. From these figures, it is relatively easy to determine, according to the calendar year of birth, the distribution of individuals who immigrated between June 1, 1976 and June 1, 1977. Their distribution according to census year of birth is graphically simulated in Chart I, using the example of immigrants born between June 1, 1974 and June 1, 1975. This group, represented by parallelogram a b c d is considered to be composed of 7/12 of the immigrants born in 1974 and 5/12 of those born in 1975. It is readily apparent that these immigrants were between exact age one and exact age two on June 1, 1976.

(b) Emigration

Estimates of the number of emigrants are obtained indirectly by using information from three sources. The first is reports containing data on the number of immigrants to the United States, whose country of last residence was Canada; they are provided by the United States Department of Justice, Immigration and Naturalization Service. The second is estimates of the number of persons entering the United Kingdom to reside, whose country of last residence was Canada; these estimates are taken from the International Passenger Survey. Finally, on the basis of Canadian census data, vital statistics, immigration figures and information provided by the United States and the United Kingdom, it has been estimated that 20,000 persons emigrate from Canada to countries other than the United States and the United Kingdom each year.(1) Together, these three sources are used to estimate the total volume of emigration. The distribution of these emigration estimates by province of origin is accomplished by using

(1) This hypothesis is under review and will be discussed in the next issue of Catalogue 91-201 (Annual).

SOURCES DES DONNÉES

Les composantes sont estimées à l'aide de diverses sources:

a) Immigration

Le nombre des immigrants est fourni par Emploi et Immigration Canada (anciennement ministère de la Main-d'oeuvre et de l'Immigration), la province de destination étant celle où l'immigrant avait l'intention de s'établir au moment de son arrivée.

Ces statistiques ont été réunies selon l'année de naissance, pour les périodes d'immigration suivantes: janvier-décembre 1976, janvier-mai 1976 et janvier-mai 1977. On peut donc aisément reconstituer les effectifs des individus ayant immigré entre les 1^{er} juin 1976 et 1977 selon l'année civile de naissance. La répartition de ces immigrants selon l'année censitaire de naissance est illustrée par le graphique I à l'aide de l'exemple des immigrants nés entre les 1^{er} juin 1974 et 1975: on a considéré que ce groupe (représenté par le parallélogramme a b c d) est composé de 7/12 des immigrants nés en 1974 et de 5/12 de ceux nés en 1975. Le même graphique fait immédiatement apparaître que ces individus avaient un an révolu le 1^{er} juin 1976.

b) Émigration

Le nombre des émigrants est estimé indirectement à l'aide de trois sources. D'abord, il y a les rapports fournis par le United States Department of Justice, Immigration and Naturalization Service, qui indiquent le nombre de personnes ayant immigré aux États-Unis et dont le pays de dernière résidence était le Canada. En second lieu, on dispose d'estimations du nombre de personnes qui ont immigré au Royaume-Uni et dont le pays de dernière résidence était le Canada; ces effectifs proviennent d'une enquête: l'International Passenger Survey. Enfin, à partir des données des recensements canadiens, des statistiques de l'état civil, de celles de l'immigration, ainsi que des données fournies par les États-Unis et le Royaume-Uni, on a établi à 20,000 annuellement(1) le nombre d'émigrants à destination de pays autres que les États-Unis et le Royaume-Uni. La combinaison de ces trois sources permet d'estimer l'effectif total des émigrants. Pour les répartir selon la province d'origine, on a eu recours aux données les plus récentes fournies par l'ambassade des États-Unis: le nombre de visas émis par chacun des huit consulats

(1) Cette hypothèse est en voie de révision et il en sera question dans la prochaine livraison du n° 91-201 au catalogue (annuel).

the most recent data compiled by the United States Embassy on the number of immigration visas issued during the 1975-1976 census year by each of the eight American consulates in Canada, wherein each prospective emigrant was required to file an application with the consulate serving the province or region in which he resided.

au cours de l'année censitaire 1975-1976, chaque demande de visa devant être déposée au consulat qui dessert la province ou la région de résidence.

Chart I

Graphique I

Transition from a Series of Data Based on Calendar Year of Birth and of Immigration to a Series of Data Based on Census Year of Birth and of Immigration

Illustration du passage d'une série de données selon l'année civile de naissance et d'immigration à une série suivant l'année censitaire de naissance et d'immigration

The distribution by age group and sex of individuals who migrated to the United States during the 1975-1976 census year, and whose country of last residence was Canada, is also known. Due to a lack of more comprehensive data, it was necessary to assume that this distribution applies to all emigrants from Canada, regardless of their province of origin or their country of destination. Sprague's

Pour l'année censitaire en cause, on connaît également la répartition selon le sexe et le groupe d'âges des individus qui ont immigré aux États-Unis et dont le pays de dernière résidence était le Canada. Faute de données plus complètes, on a dû faire l'hypothèse que cette répartition s'applique à l'ensemble des émigrants du Canada, quelle que soit la province d'origine ou le pays de destination. Pour passer de la répartition des émigrants

formula(2) was used to convert the resulting quinary age group distribution into an individual year of age distribution. The age computed in this fashion is the one ascribed to the emigrants as of June 1, 1976, or the beginning of the year under consideration.

(c) Interprovincial Migration

Interprovincial migration is estimated from family allowance records. Each Regional Office uses the change of address notifications which it receives from family allowance recipients to produce monthly tables on the number of family allowance families who have moved, by size of family (i.e., the number of children eligible for family allowance benefits) and by province of origin and destination. By using these basic data and the equations below, estimates of the total number of out-migrants from each province, by province of destination, are obtained.

$$M_{(j,k)}^a = \frac{M_{(j,k)}^e}{P_j^e} \cdot F_j \cdot P_j^a$$

$$M_{(j,k)}^t = M_{(j,k)}^e + M_{(j,k)}^a$$

$$M_j^t = \sum M_{(j,k)}^t$$

where the meaning of the symbols is as follows:

$M_{(j,k)}^e$: number of children who moved from province j to province k;

$M_{(j,k)}^a$: number of adults (18 years of age and over) who moved from province j to province k;

$M_{(j,k)}^t$: total number of out-migrants from province j to province k;

F_j : adjustment factor for province j wherein this factor represents the ratio obtained by dividing the out-migration rate for adults (persons 18 years of age and over) by that of children (persons aged 0-17), as calculated from the 1971 Census;

P_j^e : number of children eligible for family allowances in province j as shown in the monthly report of Health and Welfare Canada;

(2) See U.S. Bureau of the Census, The Methods and Materials of Demography, by H. Shryock, J. Siegel and Associates, Second Printing (rev.), U.S. Government Printing Office, Washington, D.C., 1973, pp. 688, 699-701 and 876.

par groupes de cinq années d'âge ainsi obtenue à une répartition suivant l'année d'âge, on a eu recours à la formule de Sprague(2). C'est l'âge ainsi calculé qui a été attribué aux émigrants au début de l'année considérée, c'est-à-dire le 1^{er} juin 1976.

c) Migration interprovinciale

La migration interprovinciale est estimée à l'aide du fichier des allocations familiales. À partir des avis de changement d'adresse, chaque bureau régional prépare des tableaux mensuels indiquant le nombre de familles admissibles aux allocations familiales qui ont déménagé, selon leur taille (c'est-à-dire le nombre d'enfants admissibles aux allocations familiales), leur province d'origine et celle de destination. À l'aide de ces données de base et des équations qui suivent, on a estimé, pour chaque province, l'effectif total des sortants selon la province de destination.

où l'on désigne par

$M_{(j,k)}^e$: le nombre d'enfants sortant de la province j à destination de la province k;

$M_{(j,k)}^a$: le nombre d'adultes (18 ans et plus) sortant de la province j à destination de la province k;

$M_{(j,k)}^t$: le nombre total de sortants de la province j à destination de la province k;

F_j : le facteur d'ajustement pour la province j, c'est-à-dire le rapport entre le taux de sortie des adultes âgés de 18 ans et plus et celui des enfants (0-17 ans), calculé d'après les résultats du recensement de 1971;

P_j^e : l'effectif des enfants admissibles aux allocations familiales dans la province j, tiré du rapport mensuel du ministère de la Santé et du Bien-être social, Canada;

(2) À ce sujet, voir U.S. Bureau of the Census, The Methods and Materials of Demography, by H. Shryock, J. Siegel and Associates, Second Printing (rev.), U.S. Government Printing Office, Washington, D.C., 1973, pp. 688, 699-701 et 876.

P_j^a : estimated number of adults (18 years of age and over) in province j;
 M_j^t : total number of out-migrants from province j to other provinces.

P_j^a : l'estimation du nombre d'adultes (18 ans et plus) dans la province j;
 M_j^t : le nombre total de sortants de la province j à destination des autres provinces.

By listing all the values thus obtained for $M_{(j,k)}^t$ in a double-entry table (with the rows indicating province of origin and the columns, province of destination), the total number of out-migrants and in-migrants for each province can be obtained by simply adding up the figures horizontally and vertically.

The age and sex distribution of these migrants was determined on the basis of the results of the 1971 Census. These migrants were divided up into two categories: individuals five years of age and over who resided in different provinces on June 1, 1966 and June 1, 1971, (3) and Canadian-born individuals under five years of age who, on June 1, 1971, resided in a province other than their province of birth. The age and sex distribution of the first group was determined on the basis of respondents' replies to the 1971 Census question, "Where did you live five years ago on June 1, 1966?". The provincial sex distribution of the second group was already known; its age distribution was determined from family allowance records. These two series were then used to produce individual provincial age and sex distributions of the in-migrants, contingent on the assumption that their age and sex distribution is unrelated to their province of origin. Each of these distributions was then applied to the values for $M_{(j,k)}^t$, subject to the following constraint: the total number of migrant children (ages 0-17) had to correspond to the figure listed in the family allowance records. This procedure produced the distribution of in-migrants according to age, sex and province of origin which, in turn, permitted the calculation of the net migration gains or losses experienced by each province during the 1976-1977 census year, according to the age and sex of the migrants concerned, as of June 1, 1976.

(3) This group therefore includes only those individuals enumerated in 1971 who were also present in Canada on June 1, 1966, and excludes those who made two or more interprovincial moves between the two censuses, but resided in the same province on June 1, 1966 and June 1, 1971. It also excludes interprovincial migrants who were not present in Canada on one or both of these census dates.

En reportant les valeurs de $M_{(j,k)}^t$ ainsi obtenues dans un tableau à double entrée (les lignes désignant la province d'origine et les colonnes celle de destination), on obtient facilement, par simple sommation des lignes et des colonnes, l'effectif des sortants et des entrants pour chaque province.

Pour répartir ces migrants selon le sexe et l'âge, on a eu recours aux résultats du recensement de 1971, en distinguant deux cas: d'une part, les individus de cinq ans et plus qui ne résidaient pas dans la même province le 1^{er} juin 1966 et le 1^{er} juin 1971 (3); d'autre part, ceux âgés de moins de cinq ans, nés au Canada et qui résidaient le 1^{er} juin 1971 dans une province autre que celle de leur naissance. Les premiers ont été répartis selon le sexe et l'âge grâce à la question: "Où habitiez-vous il y a cinq ans, c'est-à-dire le 1^{er} juin 1966?" posée lors du recensement de 1971. Quant aux seconds, on dispose, pour chaque province, d'un effectif selon le sexe; la ventilation suivant l'âge est effectuée à l'aide de données provenant du fichier des allocations familiales. À partir des effectifs de ces deux séries, on a construit, pour chaque province, une seule répartition en pourcentage des entrants selon le sexe et l'âge, après avoir fait l'hypothèse que la province d'origine des entrants n'influence pas leur répartition selon le sexe et l'âge. Chacune de ces répartitions a ensuite été appliquée aux effectifs $M_{(j,k)}^t$, avec cependant une contrainte: l'effectif des enfants migrants (0-17 ans) doit être égal à celui fourni par le fichier des allocations familiales. On aboutit donc, pour chaque province, à une répartition des entrants selon le sexe, l'âge et la province d'origine, ce qui permet ensuite de calculer, pour la période 1976-1977, un solde migratoire interprovincial selon le sexe et l'âge au 1^{er} juin 1976.

(3) Cela ne comprend donc que des individus recensés en 1971 qui étaient également présents au Canada le 1^{er} juin 1966. Ceux qui ont effectué deux ou plusieurs migrations interprovinciales entre les deux recensements, mais qui résident dans la même province les 1^{er} juin 1966 et 1971, n'apparaissent pas ici; c'est aussi le cas des migrants interprovinciaux qui n'étaient pas présents au Canada soit à l'une des dates de recensement, soit aux deux.

(d) Births

The total number of births occurring during the periods of June-December 1976 and January-May 1977 was calculated on the basis of the vital statistics published in Catalogue 84-001. These figures have been adjusted for certain provinces.

Since the sex distribution of these births is not yet available, the sex ratio at birth of children born during the 1975 calendar year has been substituted for it.

d) Naissances

Leur nombre total a été calculé, pour les périodes juin-décembre 1976 et janvier-mai 1977, à partir des statistiques de l'état civil publiées dans le n° 84-001 au catalogue. Pour certaines provinces, ces données ont été ajustées.

La répartition selon le sexe n'étant pas encore disponible, on a utilisé le rapport de masculinité à la naissance observé durant l'année civile 1975.

Chart II

Transition from a Death Distribution by Age to a Death Distribution by Age and Birth Cohort

Graphique II

$$(D_{(x)} = \text{Deaths at age } x) - (D_{(x)} = \text{décès à l'âge } x)$$

a. By complete years of age

Selon l'âge en années révolues

b. By age and birth cohort

Selon l'âge et la génération

(e) Deaths

The total number of deaths occurring during the periods of June-December 1976 and January-May 1977 was calculated on the basis of data published in Catalogue 84-001. These figures have been adjusted for certain provinces.

In order to produce postcensal estimates, it is first necessary to know the number of deaths per census year (June 1-May 31), by age and cohort, in this case the census year of birth. Since the age-sex distribution of deaths occurring during the 1976-1977 census year was not yet available at the time these estimates were compiled, the corresponding 1975-1976 distribution was substituted for it. Total deaths were then broken down according to the census year of birth of the deceased and his age at death (zero years, one year and two years and over). Data from various years were used to determine the distribution illustrated in Chart IIb, in which the age of the deceased on June 1, 1976 can be readily determined according to the cohort to which he belongs.

HIGHLIGHTS

Information about the age and sex structure of the population at a particular date is of great interest because of its many consequences, particularly in socio-economic terms.(4)

(a) Age Structure

Chart III shows clearly the age structure of Canada's population for both sexes.

The general triangular form of the population pyramid shown in that chart is due mainly to mortality, which progressively reduces the size of successive age categories. In addition to age, there is also the cohort factor: individuals born in the same year become subject to events unique to them, and these events may have affected the age structure of June 1, 1977. By presenting data by single years of age as a pyramid, an overview of the history of the Canadian population since the turn of the century is obtained.

Starting with the summit of the pyramid for 1977 (Chart III) a few of the events that have influenced the shape of the pyramid for both males and females will be noted. The first irregularity in shape occurs for persons born in the 1915-1919 period, and this indentation is the result of the deficit of

(4) For an example of this type of analysis, see R. Pressat, L'analyse démographique (2^e édition), Paris, P.U.F., 1969, pp. 216-220.

e) Décès

Leur effectif a été calculé pour les périodes juin-décembre 1976 et janvier-mai 1977, à partir des données publiées dans le n° 84-001 au catalogue, qui ont fait l'objet d'ajustements dans le cas de certaines provinces.

La production des estimations postcensitaires exige que l'on connaisse ces décès par année censitaire (1^{er} juin-31 mai) selon l'âge et la génération, en l'occurrence l'année censitaire de naissance. Comme la répartition des décès de la période 1976-1977 selon le sexe et l'âge au décès n'était pas encore disponible au moment de produire ces estimations, on a utilisé la même que pour l'année 1975-1976. La répartition suivant l'année censitaire de naissance a ensuite été effectuée en distinguant trois cas selon l'âge au décès: zéro an, un an et deux ans et plus; d'après des observations portant sur différentes années, on a déterminé la répartition illustrée par le graphique IIb, à partir duquel il est aisé de déduire l'âge des décédés selon la génération au 1^{er} juin 1976.

TRAITS SAILLANTS

En raison de ses nombreuses conséquences, socio-économiques notamment, la connaissance de la répartition de la population selon le sexe et l'âge, à une date donnée, est d'un grand intérêt(4).

a) La structure selon l'âge

Le graphique III illustre bien, pour chacun des sexes, la structure par âge de la population du Canada.

La forme générale triangulaire de la pyramide résulte surtout de l'action de la mortalité qui, lorsqu'on avance en âge, réduit progressivement les effectifs des générations. À cet effet d'âge s'ajoute un effet de génération: les individus nés une même année ont vécu des événements qui leur sont propres et qui ont pu affecter la structure par âge observée le 1^{er} juin 1977; la représentation des données par années d'âge sous forme de pyramide permet ainsi de retracer, dans ses grandes lignes, l'histoire de la population canadienne depuis le début du siècle.

Commentons brièvement, à partir du sommet de la pyramide, quelques-uns des événements qui y ont laissé leur marque, en perturbant le tracé des courbes masculine et féminine. Une encoche, correspondant aux individus nés dans les années 1915-1919, met en évidence le déficit des naissances qui a résulté du premier conflit mondial. Un

Graphique III

births during the First World War. The second indentation, which affects a larger number of single years of age, is caused by three factors: the drop in fertility during the Depression of the 1930s(5) (i.e., postponed marriages and voluntary infertility), the fact that the 1915-1919 cohorts, themselves small, were in their reproductive period and the disturbing effect of the 1939-1945 war (i.e., absent spouses and postponed marriages). Beginning in 1946, there was a recovery in births(6) which had been postponed by the Second World War, and then the baby boom. This accounts for the bulge in the pyramid up to around 1960. The remaining indentation in the pyramid is caused by the recent drop in fertility, which has been particularly marked since 1965, and by the reduced number of women of childbearing age, who had been born during the Depression or the Second World War. We should also mention that the many cohorts from the baby boom are reaching their reproductive period; if there is no significant change in couples' reproductive behaviour, we will see an increase in the number of births in the next few years, and hence a broadening of the base of the pyramid (which is already apparent).

The analysis of age structure usually includes some reference to the size of broad age groups:(7) 0-14 years (children), 15-64 years (adults), and 65 years and over (the elderly). The percentage distribution among these groups indicates the relative importance of elderly persons within the population (Table 3). Some measures, such as the dependency ratio, are useful for comparative purposes, even though they provide only an approximate indication of the dependency of the various population groups. For example, in Newfoundland there are 544 children and 111 elderly persons per 1,000 adults, while

autre déficit, qui touche un plus grand nombre d'années d'âge, est imputable à trois facteurs: la baisse de la fécondité durant la crise économique des années trente(5) (mariages différés et infécondité volontaire), le passage à l'âge de fécondité des classes creuses nées en 1915-1919 et l'effet perturbateur de la guerre de 1939-1945 (couples séparés et mariages différés). Dès 1946, on assiste à une "récupération" des naissances(6) retardées par le second conflit mondial, puis à un important regain de la fécondité ("baby boom"): cela explique le renflement de la pyramide jusque vers 1960. Le rétrécissement de la pyramide observé ensuite est dû à la chute récente de la fécondité, particulièrement nette depuis 1965, et à l'effectif réduit des femmes en âge de procréer, nées durant la crise économique ou la dernière guerre. Soulignons enfin que les générations nombreuses du "baby boom" arrivent à l'âge de fécondité; si le comportement procréateur des couples ne se modifie pas de façon importante, cela se traduira par une augmentation du nombre de naissances durant les quelques années à venir, donc par l'élargissement, déjà perceptible, de la base de la pyramide.

L'analyse de la structure par âge est habituellement accompagnée de calculs faisant intervenir les effectifs de grands groupes d'âges(7): 0-14 ans (enfants), 15-64 ans (adultes) et 65 ans et plus (personnes âgées). Leur répartition en pourcentage permet notamment de juger du degré de vieillissement de la population en cause, celui-ci étant mesuré par l'importance relative des personnes âgées (tableau 3). Certains rapports d'effectifs, tels que le rapport de dépendance, mesurent de façon plus ou moins précise la charge que représentent différentes catégories de la population, mais illustrent bien certaines comparaisons. Ainsi, alors qu'à Terre-Neuve on compte 544 enfants

- (5) Actually, the decline in the number of births had begun prior to the Depression falling from a level of 256,875 in 1921-1922, and not reaching this level again until 1941-1942, at which time there were 260,962 births in Canada. See M. Fleming, "Births, Deaths and Immigration on a Census-year Basis for Canada and the Provinces, 1921 - (Immigration 1931 -) 1966", Technical Memorandum (General Series), No. 14, Population Estimates and Projections, Census Division, Dominion Bureau of Statistics, Ottawa, January 20, 1967, Table 2.
- (6) This is evident from the substantial increase in the number of births, which went from 298,776 in 1945-1946 to 354,345 the following census year. See M. Fleming, op. cit., Table 2.
- (7) Other groups, such as 0-19 years, 20-64 years and 65 years and over, are sometimes used.

- (5) En fait, la baisse du nombre des naissances a été sensible dès 1921-1922; égal à 256,875 cette année censitaire-là, ce nombre n'est revenu à un niveau guère plus élevé (260,962 naissances) que 20 ans plus tard, en 1941-1942, et ce malgré la croissance démographique durant cette période. Voir M. Fleming, "Births, Deaths and Immigration on a Census-year Basis for Canada and the Provinces, 1921 - (Immigration 1931 -) 1966", Technical Memorandum (General Series), No. 14, Population Estimates and Projections, Census Division, Dominion Bureau of Statistics, Ottawa, January 20, 1967, tableau 2.
- (6) Cela se traduit par une forte augmentation du nombre des naissances qui passe de 298,776 en 1945-1946 à 354,345 l'année censitaire suivante. Voir M. Fleming, op. cit., tableau 2.
- (7) On adopte parfois d'autres regroupements, par exemple: 0-19 ans, 20-64 ans et 65 ans et plus.

in British Columbia the figures are 354 and 152 per 1,000 respectively. The total dependency ratio, expressed per 1,000, is the sum of these two figures: hence in Newfoundland, there are 655 children and elderly persons per 1,000 adults as compared to 506 in British Columbia. For information about the composition of this dependent population, the aged-to-child ratio is used, and it is another useful index of the age structure of a population. Using the previous examples, it can be seen that in Newfoundland there are 204 elderly persons per 1,000 children compared to 430 (which is more than twice as many) in British Columbia. In this connection, it should be recalled that Newfoundland is a high fertility province, whereas fertility levels in British Columbia are low.

(b) Sex Ratio by Age

The dissymmetry of the age pyramid makes it difficult to see the disproportionate number of males and females of various ages in the population. This imbalance between the sexes is more visible in Chart IV, which shows the differences in the sex ratio for persons of different years of age.

As before, in order to analyse changes in this ratio, a distinction is made between the age effect and the cohort effect. The impact of the age effect can be summarized as follows: approximately 105 boys are born for every 100 girls, but because of the excess mortality among males, this ratio decreases as age increases (particularly at ages 45 and higher), thereby resulting in the general shape of the curve as shown in Chart IV. The cohort effect changes the curve that would result from mortality alone. This is because each cohort is unique and experiences events which serve to alter the sex ratio that would result from the age effect alone. For example, some variations in the excess mortality of males are caused by wars.(8) In addition, changes in health conditions or life-style have affected the mortality of one sex more than the other, just as migration may affect one sex more than the other, and thus events like these can also affect the age and sex composition of the population.

(8) For example, in 1944-1945, 82,873 males died compared to 50,578 females. In 1945-1946, these figures were 65,246 and 51,162 respectively. See M. Fleming, op. cit., Table 4.

et 111 personnes âgées pour 1,000 adultes, ces effectifs sont de 354 et 152 respectivement en Colombie-Britannique. Le rapport global de dépendance est, exprimé pour 1,000, la somme de ces deux effectifs: il permet par exemple de dire qu'à Terre-Neuve il y a 655 enfants et personnes âgées pour 1,000 adultes, contre 506 en Colombie-Britannique. On peut également s'intéresser à la composition de cette population dite dépendante; on utilise alors un rapport qui constitue aussi une mesure du degré de vieillissement: le rapport personnes âgées-enfants. En reprenant les exemples précédents, on dira qu'à Terre-Neuve, il y a 204 personnes âgées pour 1,000 enfants contre 430 (plus du double!) en Colombie-Britannique. Dans le premier cas, on est en présence d'une province à haute fécondité et dans le second, d'une province à faible fécondité.

(b) La masculinité selon l'âge

La dissymétrie de la pyramide des âges ne permet pas de discerner clairement l'inégalité, selon le sexe, des effectifs des divers âges. Ce déséquilibre des sexes apparaît plus nettement sur le graphique IV, qui reproduit l'évolution suivant l'âge du rapport de masculinité.

L'analyse de l'évolution de ce rapport exige, comme précédemment, que l'on sépare l'effet d'âge de l'effet de génération. L'impact de ce premier effet peut se résumer ainsi: il naît environ 105 garçons pour 100 filles mais, à cause de la surmortalité masculine, ce rapport diminue lorsqu'on avance en âge (cela est particulièrement net après l'âge de 45 ans); ce phénomène explique l'allure générale de la courbe du graphique IV. L'effet de génération vient perturber le tracé que la mortalité seule imposerait à cette courbe. En effet, chaque génération a une histoire distincte, parsemée d'événements qui ont pu modifier le rapport de masculinité qui résulterait uniquement de l'effet d'âge. Citons, à titre d'exemple, les variations de la surmortalité masculine causées par une guerre(8); d'autre part, des modifications des conditions sanitaires ou du mode de vie peuvent avoir, sur la mortalité, des effets qui se feront sentir davantage chez les individus d'un sexe donné. Signalons enfin les migrations qui peuvent affecter un sexe plutôt que l'autre.

(8) Par exemple, en 1944-1945, on a observé 82,873 décès du sexe masculin contre 50,578 seulement du sexe féminin; ces nombres étaient respectivement de 65,246 et 51,162 en 1945-1946. Voir M. Fleming, op. cit., tableau 4.

Chart IV

Graphique IV

Sex Ratio by Age, Canada, June 1, 1977

Rapport de masculinité selon l'âge, Canada, 1^{er} juin 1977

Source: Table 2 and unpublished data by single years of age for the population aged 70-89.—Tableau 2 et données non publiées par années d'âge pour la population âgée de 70-89 ans.

INTERPRETATION OF FINDINGS

It should be recalled that the population figures published here for June 1, 1977 are estimates and, as such, are subject to

INTERPRÉTATION DES RÉSULTATS

Rappelons que les effectifs de la population au 1^{er} juin 1977 publiés ici sont des estimations et comportent une certaine marge d'erreur. Ces

certain errors. These preliminary postcensal estimates, obtained using the June 1, 1976 Census counts as the base population, are especially affected by:

1. undercoverage in the census on which the calculations are based. It should be noted that the rate of undercoverage varies not only according to the province but also according to age and sex, as illustrated in Table I; (9)
2. errors in the estimates of the components of population change. These errors may vary in magnitude according to age, sex, and the province concerned. It should be pointed out that the errors in the estimates of certain components such as births or emigration may affect some age groups more than others. It should also be recalled that the component data are preliminary (provisory) in nature.

(9) Refer to Gosselin, J.-F. and Thérout, G., "Basic Results on Population and Household Undercoverage in the 1976 Census" (1976 Census Parametric Evaluation Project, Reverse Record Check), Census Survey Methods Division, Statistical Services Field, Statistics Canada, Ottawa, March 1978.

estimations postcensitaires provisoires, obtenues en prenant comme base la population dénombrée le 1^{er} juin 1976, sont surtout affectées par:

1. le sous-dénombrement lors du recensement qui sert de base aux calculs. Il est à noter que le taux de sous-dénombrement varie d'une province à l'autre, mais aussi selon le sexe et l'âge comme le montre le tableau I (9);
2. l'erreur provenant de l'estimation des composantes et dont l'importance peut varier suivant le sexe, l'âge ou la province concernée. Mentionnons notamment que des erreurs portant sur certaines composantes (naissances ou émigration, par exemple) peuvent affecter davantage certains groupes d'âges. Rappelons enfin que les données sur les composantes sont provisoires.

(9) Voir à ce sujet Gosselin, J.-F. et Thérout, G., "Principaux résultats concernant le sous-dénombrement de la population et des ménages lors du recensement de 1976" (Projet d'évaluation paramétrique, recensement de 1976, Contre-vérification des dossiers), Division des méthodes d'enquêtes-recensement, Secteur des services statistiques, Statistique Canada, Ottawa, mars 1978.

TABLE I. Estimated Population Undercoverage Rates by Sex and Age Group, Canada (Excluding the Yukon and the Northwest Territories), 1976 Census

TABLEAU I. Estimation du taux de sous-dénombrement de la population selon le sexe et le groupe d'âges, Canada (sans le Yukon et les Territoires du Nord-Ouest), recensement de 1976

| Age group — Groupe d'âges | Male — Masculin | | Female — Féminin | | Both sexes — Sexes réunis | |
|---------------------------------------|------------------------------------------|-------------------------------------------|------------------------------------------|-------------------------------------------|------------------------------------------|-------------------------------------------|

DEFINITIONS

Population

"Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence ... was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily." (Dictionary of the 1971 Census Terms, Catalogue 12-540, page 28)

Census Year

The census year refers to the period beginning June 1 of a given year and ending May 31 of the following year. June 1 is Census Day.

Number of Complete Years Lived

Age at last birthday.

Birth Cohort

A group of persons born within a given 12-month period, the calendar year in general. Here, unless otherwise indicated, this period will exactly coincide with the census year.

June 1 Postcensal Population Estimate

For a given cohort, this is the estimate which is obtained by taking as a base the size of that cohort as of June 1 in the preceding year, and taking into account the demographic events which affected the cohort since that date.

Interprovincial Migration

Movements from one province to another involving a change in residence. A person who takes up residence in another province is an out-migrant with reference to his province of origin, and an in-migrant with reference to his province of destination.

DÉFINITIONS

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle ... était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". (Dictionnaire des termes du recensement de 1971, n° 12-540 au catalogue, page 22)

Année censitaire

Par référence à la date habituelle du recensement, on a convenu de désigner ainsi la période qui s'étend du 1^{er} juin d'une année au 31 mai suivant.

Âge en années révolues

Âge au dernier anniversaire.

Génération

Ensemble des personnes nées durant une même période de 12 mois, l'année civile en général. Sauf indication contraire, il s'agit ici des individus nés la même année censitaire.

Estimation postcensitaire de la population au 1^{er} juin

Pour une génération donnée, il s'agit de l'estimation obtenue en prenant comme base l'effectif de cette génération au 1^{er} juin de l'année précédente et en tenant compte des événements démographiques survenus depuis cette date.

Migration interprovinciale

Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement de résidence. Un individu qui effectue un tel déplacement sera un sortant pour sa province d'origine et un entrant pour sa province de destination.

International Migration

Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between immigrants from other countries who settle in Canada and emigrants who leave Canada.

Undercoverage Rate

The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Median Age

An age x, such that exactly one half of the population is older than x and the other half is younger than x.

Masculinity Ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Dependency Ratio

The total population is customarily divided up into three broad age groups: children (ages 0-14), adults (ages 15-64), and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

child dependency ratio, i.e., the number of children per adult;

aged dependency ratio, i.e., the number of aged persons per adult;

total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

A fourth ratio, the aged-to-child ratio, is sometimes used. It represents the number of aged persons per child.

The same ratios are sometimes defined on the basis of the following categories: children (ages 0-19), adults (ages 20-64), and aged persons (ages 65 and over).

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement de résidence. On distingue à cet égard les immigrants, qui viennent s'établir au Canada et les émigrants, qui quittent le Canada.

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Âge médian

Âge x tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à x, l'autre des individus d'âge inférieur à x.

Rapport de masculinité

Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

Rapport de dépendance

On a coutume de répartir la population en trois grands groupes d'âges: 0-14 ans (enfants), 15-64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

le rapport de dépendance des enfants, égal au nombre d'enfants par adulte;

le rapport de dépendance des personnes âgées qui représente le nombre de personnes âgées par adulte;

le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Une autre mesure — le rapport personnes âgées-enfants — est parfois utilisée; elle renseigne sur le nombre de personnes âgées par enfant.

Les mêmes calculs sont parfois effectués en retenant les catégories suivantes: 0-19 ans (enfants), 20-64 ans (adultes) et 65 ans et plus (personnes âgées).

MEDIAN AGE (YEARS)-
AGE MEDIAN (ANNEES) 27.8 22.6 26.6 27.1 25.7 27.7 28.6 28.0 27.6 26.1 29.1 24.9 20.6

NOTE: AS EACH POPULATION FIGURE HAS BEEN ROUNDED INDEPENDENTLY TO THE NEAREST HUNDRED, TOTALS FOR AGE GROUPS DO NOT NECESSARILY EQUAL THE SUM OF THE CORRESPONDING FIGURES FOR INDIVIDUAL AGES. MEDIAN AGE IS BASED ON UNROUNDED DATA, BY SINGLE YEARS OF AGE. - NOTÉ: COMME CHAQUE EFFECTIF DE POPULATION A ÉTÉ ARRondi SEPARÉMENT À LA CENTAINE PRES, LES EFFECTIFS DES GROUPES D'AGES NE SONT PAS NECESSAIREMENT ÉGAUX À LA SOMME DES EFFECTIFS PAR ANNEES D'AGE CORRESPONDANTS. L'AGE MEDIAN EST CALCULÉ À PARTIR DES DONNÉES NON-ARRONDIES PAR ANNEES D'AGE.

| MEDIAN AGE (YEARS)- AGE MEDIAN (ANNEES) | | | | | | | | | | | | | |
| | 28.2 | 22.9 | 26.9 | 27.4 | 26.0 | 28.1 | 28.9 | 28.3 | 27.6 | 26.4 | 29.6 | 25.2 | 21.0 |

NOTE: AS EACH POPULATION FIGURE HAS BEEN ROUNDED INDEPENDENTLY TO THE NEAREST HUNDRED, TOTALS FOR AGE GROUPS DO NOT NECESSARILY EQUAL THE SUM OF THE CORRESPONDING FIGURES FOR INDIVIDUAL AGES. MEDIAN AGE IS BASED ON UNROUNDED DATA, BY SINGLE YEARS OF AGE. - NOTA: COMME CHAQUE EFFECTIF DE POPULATION A ETE ARRONDI SEPAREMENT A LA CENTAINE PRES, LES EFFECTIFS DES GROUPES D'AGES NE SONT PAS NECESSAIREMENT EGUAUX A LA SOMME DES EFFECTIFS PAR ANNEES D'AGE CORRESPONDANTES. L'AGE MEDIAN EST CALCULE A PARTIR DES DONNEES NON-ARRONDIS PAR ANNEES D'AGE.

-- LESS THAN 50 PERSONS. - MOINS DE 50 PERSONNES.

Farm Cash Receipts, January-June 1979 — Advance Information

Preliminary estimates indicate that during the January to June period of 1979 farmers' total cash receipts from farming operations in all provinces except Newfoundland amounted to \$6,796.3 million compared to \$5,641.4 million realized during the same period of 1978.

The total estimates include: cash receipts from the sale of farm products; Canadian Wheat Board participation payments on previous years' grain crops; cash advances on farm-stored grains in Western Canada; and deficiency payments made by the Agricultural Stabilization Board. No deduction is made for the cost incurred by farmers in the production of the commodities sold.

For further information, order the January-June issue of *Farm Cash Receipts* (21-001, 30¢/\$3), or contact Peter Lys (613-995-4895), Agriculture Division, Statistics Canada, Ottawa K1A 0L7.

Total Cash Receipts from Farming Operations

January-June
(millions of dollars)

| | 1978 | 1979 |
|----------------------|----------------|----------------|
| Prince Edward Island | 49.8 | 62.4 |
| Nova Scotia | 65.1 | 79.6 |
| New Brunswick | 57.3 | 69.8 |

| Ontario | 1,547.1 | 1,871.1 |
| Manitoba | 506.4 | 582.0 |
| Saskatchewan | 1,285.6 | 1,470.1 |
| Alberta | 1,133.0 | 1,491.0 |
| British Columbia | 237.5 | 256.4 |
| Canada | 5,641.4 | 6,796.3 |

Particle Board, June 1979 — Advance Information

Canadian firms produced 34,345,000 square feet 5/8" basis (50 653 m³) of Type I particle board and 42,857,000 square feet 5/8" basis (63 207 m³) of Type II particle board in June compared to 28,040,000 square feet 5/8" basis (41 354 m³) of Type I and 39,646,000 square feet 5/8" basis (58 471 m³) of Type II produced in June 1978. This represents an increase in production of Type I of 22.5% and an increase in production of Type II of 8.1%.

For further information, contact Colin Sturton (613-992-5140), Manufacturing and Primary Industries Division, Statistics Canada, Ottawa K1A 0V6, or order the June issue of *Particle Board* (36-003, 15¢/\$1.50).

Airport Activity, Annual 1978 Statistics — Advance Information

Summary statistics on total airport activity in Canada and detailed statistics for the top 50 airports in Canada are now available for 1978.

For all scheduled flights operated by transcontinental, regional and international carriers, revenue and non-revenue deplaned plus enplaned passengers at all Canadian airports totalled 42,908,826 persons in 1978, an increase of 6.2% over the previous year.

The accompanying table provides statistics on total scheduled deplaned plus enplaned passengers at the top 10 airports in Canada for 1978, with comparative data for 1977 and percentage changes between years.

For further information, contact E. Di Sanza (819-997-1986), Airport Activity Survey, Aviation Statistics Centre, Transportation and Communications Division, Statistics Canada, Ottawa K1A 0N9.

INTRODUCTION

For years other than census years, Statistics Canada publishes regularly postcensal estimates of the total population by age and sex as of June 1, which are calculated on the basis of the results of the preceding census.

This publication contains preliminary postcensal estimates of the population by sex and age as of June 1, 1978, and final postcensal estimates by sex and age as of June 1, 1977. These latter estimates replace the preliminary estimates for 1977 that were published in the previous edition of this publication.

It should be noted that, in the past, Statistics Canada published only one series of postcensal estimates by age and sex. Beginning with June 1, 1977, two series of postcensal estimates are published: preliminary postcensal estimates and final postcensal estimates. The final postcensal estimates will be revised at a later date in light of the results of the 1981 Census in order to provide intercensal population estimates (formerly called "revised estimates") by age and sex. Catalogue 91-512, Occasional (July 1973) and Catalogue 91-518, Occasional (March 1979) contain the intercensal estimates for the periods 1921-1971 and 1971-1976 respectively.

Methodology

The final postcensal estimates for June 1, 1977 contained herein were obtained by the component method, using the 1976 Census counts as the base population.

The demographic events that were experienced during the 12-month period commencing June 1, 1976 by each cohort, which is defined here as the total number of persons born during a given census year, were compiled as follows: (the June 1, 1976 population count plus total immigrants) minus (total deaths plus total emigrants). The same mathematical procedure is applied to individuals born during the period of June 1, 1976 to May 31, 1977, who therefore would have lived less than one complete year by June 1, 1977. It is also necessary to add the interprovincial net migration experienced by each province; obviously, the net migration gains and losses sum to zero at the national level. This produces a final postcensal estimate for each age or age group and each sex as of June 1, 1977.

INTRODUCTION

Sauf pour les années de recensement, Statistique Canada publie régulièrement des estimations postcensitaires de la population selon le sexe et l'âge au 1^{er} juin, calculées à partir des résultats du dernier recensement.

Cette publication présente les estimations postcensitaires provisoires de la population selon le sexe et l'âge au 1^{er} juin 1978, ainsi que les estimations postcensitaires définitives au 1^{er} juin 1977, qui remplacent celles parues en novembre 1978.

Il faut noter que, dans le passé, Statistique Canada ne publiait qu'une série d'estimations postcensitaires selon le sexe et l'âge. À compter du 1^{er} juin 1977, on dispose de deux séries d'estimations postcensitaires publiées: les estimations postcensitaires provisoires et les postcensitaires définitives. Ces dernières seront révisées à la lumière des résultats du recensement de 1981 pour donner lieu à des estimations intercensitaires (anciennement "estimations révisées") de la population selon le sexe et l'âge. Les publications hors série nos 91-512 (juillet 1973) et 91-518 (mars 1979) au catalogue présentent ces estimations intercensitaires pour les périodes 1921-1971 et 1971-1976 respectivement.

Méthodologie

Les estimations postcensitaires définitives au 1^{er} juin 1977, obtenues par la méthode des composantes, ont comme point de départ les résultats du recensement de 1976.

Ainsi, pour chaque génération, définie ici comme l'ensemble des personnes nées au cours d'une même année censitaire, on a tenu compte des événements démographiques survenus durant la période de 12 mois commençant le 1^{er} juin 1976. À l'effectif recensé à cette date on a donc ajouté le nombre des immigrants, puis on en a retranché le nombre des décès et des émigrants. La même comptabilité est appliquée aux individus nés durant la période du 1^{er} juin 1976 au 31 mai 1977 et qui auront donc moins de un an le 1^{er} juin 1977. Pour chaque province, il faut en outre ajouter le solde migratoire interprovincial, celui-ci étant évidemment nul au niveau national. On aboutit ainsi, pour chaque âge ou groupe d'âges et chacun des sexes, à une estimation postcensitaire définitive au 1^{er} juin 1977.

The same method was employed to produce the preliminary postcensal estimates for June 1, 1978, except that in this case the 1977 final postcensal estimates were used as the base population.

Data Sources

The components of population change are estimated on the basis of data gleaned from the various sources listed in Text Table I.

Interprovincial Migration

Interprovincial migration is estimated from family allowance records. Each Regional Office uses the change of address notifications which it receives from family allowance recipients to produce monthly tables on the number of family allowance families who have moved, by size of family (i.e., the number of children eligible for family allowance benefits) and by province of origin and destination. By using these basic data and the equations below, estimates of the total number of out-migrants from each province, by province of destination, are obtained.

$$M_{(j,k)}^a = \frac{M_{(j,k)}^e}{p_j^e} \cdot F_j \cdot p_j^a \quad [1]$$

$$M_{(j,k)}^t = M_{(j,k)}^e + M_{(j,k)}^a \quad [2]$$

where the meaning of the symbols is as follows:

- $M_{(j,k)}^e$ number of children who moved from province j to province k;
- $M_{(j,k)}^a$ number of adults (18 years of age and over) who moved from province j to province k;
- $M_{(j,k)}^t$ total number of out-migrants from province j to province k;
- F_j adjustment factor for province j wherein this factor represents the ratio obtained by dividing the out-migration rate for adults (persons 18 years of age and over) by that of children (persons aged 0 to 17), as calculated from the 1976 Census;(1)
- p_j^e number of children eligible for family allowances in province j as shown in the monthly report of Health and Welfare Canada;

(1) See International and Interprovincial Migration in Canada, 1977-78, Catalogue 91-208 (April 1979).

Les estimations postcensitaires provisoires de la population au 1^{er} juin 1978, sont obtenues par la même méthode que celle décrite ci-dessus, mais elles ont comme point de départ les estimations postcensitaires définitives du 1^{er} juin 1977.

Sources des données

Les composantes sont estimées à l'aide de diverses sources figurant au tableau explicatif I.

Migration interprovinciale

La migration interprovinciale est estimée à l'aide du fichier des allocations familiales. À partir des avis de changement d'adresse, chaque bureau régional prépare des tableaux mensuels indiquant le nombre de familles admissibles aux allocations familiales qui ont déménagé, selon leur taille (c'est-à-dire le nombre d'enfants admissibles aux allocations familiales), leur province d'origine et celle de destination. À l'aide de ces données de base et des équations qui suivent, on a estimé, pour chaque province, l'effectif total des sortants selon la province de destination.

$$M_{(j,k)}^a = \frac{M_{(j,k)}^e}{p_j^e} \cdot F_j \cdot p_j^a \quad [1]$$

$$M_{(j,k)}^t = M_{(j,k)}^e + M_{(j,k)}^a \quad [2]$$

où l'on désigne par:

- $M_{(j,k)}^e$ le nombre d'enfants sortant de la province j à destination de la province k;
- $M_{(j,k)}^a$ le nombre d'adultes (18 ans et plus) sortant de la province j à destination de la province k;
- $M_{(j,k)}^t$ le nombre total de sortants de la province j à destination de la province k;
- F_j le facteur d'ajustement pour la province j, c'est-à-dire le rapport entre le taux de sortie des adultes âgés de 18 ans et plus et celui des enfants (0 à 17 ans), calculé d'après les résultats du recensement de 1976(1);
- p_j^e l'effectif des enfants admissibles aux allocations familiales dans la province j, tiré du rapport mensuel du ministère de la Santé et du Bien-être social, Canada;

P_j^a estimated number of adults (18 years of age and over) in province j.

The age and sex distribution of these interprovincial migrants $M^t(j,k)$ was determined on the basis of the results of the 1976 Census. From data obtained in this census in answer to the question "Where did you live five years ago?", out-migrant rates by sex and birth cohort group for each province were calculated.

These out-migrant rates by sex and birth cohort group were then converted into out-migration rates by sex and age group. It is these out-migration rates, by sex and age group, which were applied to the 1976 census population figures to obtain the numbers of out-migrants for each province, by five-year age groups, and these were then used to calculate a distribution by sex and age group per 10,000 out-migrants of both sexes. Sprague's formula(2) allowed this distribution to be broken down by single years of age. The latter distribution which focused on each province of origin, was applied to the number of migrants ($M^t(j,k)$), leaving province j for province k, and this number was obtained by using equation 2 for 1976-77 and 1977-78. This enabled the net migration gains and losses experienced by each province to be calculated by sex and age for each census year. This procedure entailed making a fundamental assumption, namely, that the province of destination of out-migrants from a province does not affect their distribution by sex and by age.

P_j^a l'estimation du nombre d'adultes (18 ans et plus) dans la province j.

Pour répartir ces migrants interprovinciaux $M^t(j,k)$ selon le sexe et l'âge on a eu recours aux résultats du recensement de 1976. À partir des données recueillies lors de ce recensement à l'aide de la question où habitiez-vous il y a cinq ans, nous avons calculé des taux de sortie selon le sexe et le groupe de générations pour chaque province.

Dans une deuxième étape ces taux de sortie selon le sexe et le groupe de générations ont été transformés en taux de sortie selon le sexe et le groupe d'âges. Ce sont ces taux de sortie, selon le sexe et le groupe d'âges, que nous avons appliqués aux effectifs de la population recensée en 1976 afin d'obtenir pour chaque province des effectifs de sortants, par groupe d'âges de cinq ans, qui eux ont servi à calculer une répartition selon le sexe et le groupe d'âges pour 10,000 sortants sexes réunis. Le formule de Sprague(2) nous a permis d'éclater cette répartition en année d'âge. C'est cette dernière répartition, propre à chaque province d'origine, que nous avons appliquée à l'effectif de migrants ($M^t(j,k)$) sortis de la province j à destination de la province k, obtenu à l'aide de l'équation 2 pour les années 1976-77 et 1977-78. Ceci nous a permis de calculer un solde migratoire interprovincial selon le sexe et l'âge pour chaque année censitaire. Nous avons dû poser une hypothèse fondamentale: la province de destination des sortants d'une province n'influence pas leur répartition par sexe et par âge.

HIGHLIGHTS

As is well known by demographers, the sex and age distribution of a population changes little from year to year due to population inertia. Consequently, rather than repeat last year's summary analysis of the age structure of Canada's population,(3) we have decided to concentrate on the sex and age distribution of the population of the provinces. This publication will deal with the population of the four Atlantic provinces; the next issue in this series will examine the population of the Prairie provinces.

Sex Structure

In 1978, the sex ratio of Newfoundland was 103 (men per 100 women), as compared with approximately 100 in the other three Atlantic provinces and 99 in Canada. Moreover, Newfoundland's sex ratio far exceeded those of the other Atlantic provinces in almost all age groups, especially the 85 to 89 and 90 plus age groups (70 and 68 respectively in Newfoundland as compared with 55 and 50 in the other Atlantic provinces).

Age Structure

Figure I shows the age pyramids of the population of the Atlantic provinces and of Canada as of June 1, 1978. Since the total size of the populations differ, they were all reduced to 100,000 for purposes of comparison. The triangular shape of the four Atlantic pyramids closely resembles that of the Canada pyramid and stems both from the effects of mortality, which progressively reduces the size of successive age categories, and from the cohort effect, wherein persons belonging to the same cohort experience events unique to them, and these events may have affected the age structure of June 1, 1978. Each age pyramid in this figure contains irregularities corresponding to certain cohort groups: indentations are visible in the 1927-1938 cohorts, protrusions in the 1938-1963 cohorts, and a narrowing at the base in the 1963-1978 cohorts, all of which are similar to the irregularities observed on the Canada pyramid and discussed in the previous issue of this publication.(4)

The age pyramids of Nova Scotia, New Brunswick and Prince Edward Island are almost identical up to age 60, at which point all of the cohort groups in Prince Edward Island are

FAITS SAILLANTS

Il est bien connu des démographes que, du fait de sa grande inertie, la répartition selon le sexe et l'âge d'une population est très peu modifiée d'année en année. Par conséquent, nous avons décidé de ne pas reprendre l'analyse sommaire de la structure par âge de la population du Canada que nous avons présentée l'an passé(3), mais plutôt de nous pencher sur la répartition selon le sexe et l'âge de la population des provinces. La présente publication traitera de la population des quatre provinces de l'Atlantique, celle qui suivra s'intéressera à la population des provinces des prairies.

La structure selon le sexe

À Terre-Neuve, on compte en 1978, 103 hommes pour 100 femmes alors que dans les trois autres provinces de l'Atlantique, ce rapport se situe aux environs de 100 et qu'il est de 99 au niveau du Canada. De plus, pour presque tous les groupes d'âges, le rapport de masculinité de Terre-Neuve est supérieur à celui des autres provinces notamment de 85 à 89 ans et à 90 ans et plus où il atteint respectivement 70 et 68 comparativement à 55 et 50 environ dans les autres provinces de l'Atlantique.

La structure selon l'âge

La figure I représente la pyramide des âges de la population des provinces de l'Atlantique et du Canada au 1^{er} juin 1978. Les effectifs de population étant différents, nous les avons ramenés, pour fins de comparaison, à une même population totale de 100,000. Ces 4 pyramides épousent une forme triangulaire très similaire à celle du Canada et résultant d'une part de l'action de la mortalité qui réduit les effectifs de chaque génération au fur et à mesure qu'on avance en âge et d'autre part de l'effet de génération: les individus appartenant à une même génération ont vécu des événements qui leur sont propres et qui ont pu influencer sur la structure par âge observée au 1^{er} juin 1978. Sur chaque pyramide d'âge de ce graphique, nous observons, pour les mêmes groupes de générations; des encoches (générations 1927-1938), des gonflements (générations 1938-1963) et un rétrécissement à la base (générations 1963-1978) similaires à ceux observés sur la pyramide du Canada et discutés dans la dernière édition de cette publication(4).

Les pyramides d'âge de la Nouvelle-Écosse, du Nouveau-Brunswick et de l'Île-du-Prince-Édouard ont un profil quasi identique jusqu'à l'âge de 60 ans. Cependant, à partir de cet âge, les effectifs de

Pyramide des âges de la population du Canada et des provinces de l'Atlantique au 1er juin 1978

somewhat larger in size than the corresponding groups in Nova Scotia and New Brunswick. This is probably attributable to two demographic phenomena, namely, mortality and migration differentials between these provinces.

A superimposition of the Newfoundland and Nova Scotia pyramids points up significant discrepancies in their bases (age 0 to 19) and in their upper areas (age 35 and over). The relatively wide base of the Newfoundland pyramid can be attributed to higher fertility in that province, even though the effects of the general decline in fertility over the last 15 years are also evident in that pyramid. The tapering off of the Newfoundland pyramid after age 35 could be attributable in part to excess mortality or excess migration among Newfoundlanders, but it is more probably due to a young age structure, which usually produces the tapering effect.

Broad Age Groups

In order to better assess the degree of aging of the populations concerned, we shall examine their 1961 and 1978 distributions by broad age groups: children (0 to 17 years), adults (18 to 64 years), and the elderly (65 years and over). Each of the four Atlantic provinces is currently undergoing a slow aging process that is characterized by a slight increase (approximately 1%) in the 65 years and over proportion of the population and a sharp decrease (between 18% and 22%) in the child proportion, resulting in an increase of approximately 16% in the adult proportion. The change in the broad age group distributions of these populations between 1961 and 1978, therefore, stems primarily from the decline in fertility between these years, as opposed to the decline in mortality.(5)

A comparison of the distribution of the population of each province by broad age groups as of June 1, 1978 reveals that 39% of Newfoundland's population is under 18 years of age, as compared with 30% of Canada's, 32% of Nova Scotia's and approximately 33% of New Brunswick's and Prince Edward Island's. The high proportion of

chaque groupe de générations de l'Île-du-Prince-Édouard sont relativement plus nombreux qu'eux de la Nouvelle-Écosse et du Nouveau-Brunswick. Deux phénomènes démographiques ont pu contribuer à ce résultat: la mortalité et la migration différentielles dans ces provinces.

La superposition des pyramides de Terre-Neuve et de la Nouvelle-Écosse met en évidence des différences importantes à leur base (0 à 19) et aussi à leur partie supérieure (35 ans et plus). La surfécondité des Terre-neuviennes explique la forme relativement large de la base de la pyramide de Terre-Neuve, même si on y discerne aussi les effets de la baisse générale de la fécondité des quinze dernières années. Quant à la forme plus effilée de la pyramide de Terre-Neuve à compter de 35 ans, elle pourrait être en partie attribuable à une surmortalité ou à une surémigration des habitants de Terre-Neuve, mais elle est surtout typique des populations à structure jeune.

Les grands groupes d'âges

Afin de mieux juger du degré de vieillissement des populations en cause, nous examinerons la répartition des populations par grands groupes d'âges: enfants (0 à 17 ans), adultes (18 à 64 ans) et personnes âgées (65 ans et plus) en 1961 et 1978. Chacune des quatre provinces est engagée dans un lent processus de vieillissement caractérisé par une légère augmentation, environ 1 %, de la proportion des personnes âgées de 65 ans et plus, et par une forte diminution (entre 18 % et 22 %) de la proportion des enfants, ce qui engendre une augmentation d'environ 16 % dans la proportion des adultes. Le changement dans la structure par grands groupes d'âges de ces populations entre 1961 et 1978 résulte donc avant tout de la chute de la fécondité enregistrée au cours des années 1961 à 1978 plutôt que de la baisse de la mortalité(5).

Une comparaison de la répartition de la population par grands groupes d'âges pour chaque province au 1^{er} juin 1978 nous indique que 39 % de la population de Terre-Neuve est âgée de moins de 18 ans comparativement à 30 % au Canada, 32 % en Nouvelle-Écosse et environ 33 % au Nouveau-Brunswick et à l'Île-du-Prince-Édouard. La surfécondité des Terre-neuviennes signalée ci-dessus

(5) In fact, the subjecting of various populations of given structure to different combinations of mortality and fertility laws has always shown, provided the laws selected are plausible, that significant changes in population structure are solely attributable to changes in fertility, with only minimal structural changes resulting from changes in mortality, since a decline in mortality is accompanied by gains in human life at all ages (see R. Pressat, Pratique de la démographie, trente sujets d'analyse, Dunod, Paris, 1967).

(5) De fait, la soumission de diverses populations de structures données à des jeux de lois de mortalité et fécondité variables, en autant que les lois retenues sont plausibles, ont toujours démontré que les variations de fécondité sont les seules responsables de changements importants de structure, les modifications de la mortalité n'entraînent que des modifications minimales puisqu'une baisse de la mortalité s'accompagne de gains de vies humaines à tous les âges (voir R. Pressat, Pratique de la Démographie, trente sujets d'analyse, Dunod, Paris 1967).

young persons in the Newfoundland population is attributable to the higher fertility noted above. In addition, the proportion of the population aged 65 and over varies from 11.4% in Prince Edward Island to 6.3% in Newfoundland. Adults account for between 54% and 58% of the total population of the Atlantic provinces, as compared with 61% of that of Canada.

Dependency Ratios

The various dependency ratios, the child, aged and total, are other useful indicators, since they provide information on the economic burden that is borne by the adult population. The total dependency ratio in Canada declined from 0.871 (dependents per adult) in 1961 to 0.667 in 1978, or a drop of 23%. As the following table illustrates, the total dependency ratio of each of the Atlantic provinces declined a little more rapidly over the same period:

explique la forte proportion de jeunes observée à Terre-Neuve. D'autre part, la proportion des personnes âgées de 65 ans et plus varie de 11.4 % (île-du-Prince-Édouard) à 6.3 % (Terre-Neuve). Quant à la population adulte, elle représente entre 54 % et 58 % de la population totale dans les provinces de l'Atlantique contre 61 % au Canada.

Les rapports de dépendance

Les divers rapports de dépendance, celui des enfants, celui des personnes âgées ainsi que le rapport global ou total sont d'autres indices utiles à considérer puisqu'ils nous renseignent sur le fardeau économique que doivent supporter les adultes. Entre 1961 et 1978, le rapport global de dépendance au Canada est passé de 0.871 à 0.667 personnes à charge par adulte, soit une diminution de 23 %. Au cours de la même période, les rapports globaux de dépendance de chacune des provinces de l'Atlantique ont diminué un peu plus rapidement, comme on peut le voir ci-après:

| Province | Total dependency ratio | | Children dependency ratio | | Aged dependency ratio | |
|----------------------------------------------|------------------------------------|-------|-----------------------------------------|-------|----------------------------------------------------|-------|
| | Rapport global de dépendance | | Rapport de dépendance des enfants | | Rapport de dépendance des personnes âgées | |
| | 1961 | 1978 | 1961 | 1978 | 1961 | 1978 |
| Newfoundland - Terre-Neuve | 1.168 | 0.848 | 1.041 | 0.720 | 0.127 | 0.128 |
| Prince Edward Island - île-du-Prince-Édouard | 1.081 | 0.809 | 0.864 | 0.603 | 0.217 | 0.206 |
| Nova Scotia - Nouvelle-Écosse | 0.956 | 0.719 | 0.788 | 0.545 | 0.168 | 0.174 |
| New Brunswick - Nouveau-Brunswick | 1.067 | 0.747 | 0.905 | 0.584 | 0.162 | 0.163 |

Consequently, the burden borne by the adult population of these provinces was approximately 25% lighter in 1978 than in 1961.

However, a breakdown of the total dependency ratio into the aged and child dependency ratios reveals that the decline in the total dependency ratios of Newfoundland, Nova Scotia and New Brunswick between 1961 and 1978 is solely attributable to a decline of approximately 30% to 35% in the child dependency ratio, since the aged dependency ratio increased 4.8% in Nova Scotia and less than 1% in Newfoundland and New Brunswick. However, Prince Edward Island recorded increases in both the child and aged dependency ratios (30% and 5% respectively).

Par conséquent le fardeau des adultes dans ces provinces en 1978 s'est allégé en moyenne d'environ 25 % par rapport à celui de 1961.

Toutefois, une décomposition du rapport global de dépendance en rapport de dépendance des personnes âgées et en rapport de dépendance des enfants nous permet de constater que la diminution du rapport global observée à Terre-Neuve, en Nouvelle-Écosse et au Nouveau-Brunswick entre 1961 et 1978 est attribuable uniquement à une diminution du rapport de dépendance des enfants d'environ 30 % à 35 %, celui des personnes âgées s'étant accru de 4.8 % en Nouvelle-Écosse et de moins de 1 % à Terre-Neuve et au Nouveau-Brunswick. Par contre, à l'île-du-Prince-Édouard, on enregistre une diminution à la fois du rapport des enfants (30 %) et de celui des personnes âgées (5 %).

Quality of Estimates

The postcensal estimates contained in this publication have a certain margin of inaccuracy deriving both from the margin of error for 1976 Census data, which are used as the basis for the present postcensal estimates, and from errors due to the methods of estimating the components.

Among the errors which may originate with census data are coverage errors and response and processing errors. Coverage errors are caused primarily by undercoverage, since overcoverage is so rare as to be considered negligible. For Canada as a whole, the overall undercoverage rate for the 1976 Census was approximately 2%. The rate varies not only from one province to another but also by sex and age as shown in Text Table II.

Qualité des estimations

Les estimations postcensitaires contenues dans la présente publication sont entachées d'une certaine marge d'imprécision qui provient à la fois des marges d'erreur des données du recensement de 1976, population de départ des présentes estimations postcensitaires et des erreurs dues aux méthodologies d'estimation des composantes.

Parmi les erreurs imputables aux données du recensement, on retrouve les erreurs de couverture et les erreurs de réponse et d'exploitation. Les erreurs de couverture sont principalement causées par le sous-dénombrement. Le surdénombrement étant assez rare, il est considéré comme négligeable. Au niveau du Canada, le taux global de sous-dénombrement lors du recensement de 1976 fut d'environ 2 %. L'importance du taux varie non seulement d'une province à l'autre mais aussi selon le sexe et l'âge tel qu'indiqué au tableau explicatif II.

TEXT TABLE II. Estimated Population Undercoverage Rates, by Sex and Age Group, Canada (Excluding the Yukon and the Northwest Territories), 1976 Census

TABLEAU EXPLICATIF II. Estimation du taux de sous-dénombrement de la population, selon le sexe et le groupe d'âges, Canada (sans le Yukon et les Territoires du Nord-Ouest), recensement de 1976

| Age group Groupe d'âges | Male Masculin | | Female Féminin | | Both sexes Sexes réunis | |

| All ages - Tous âges | 2.46 | 0.17 | 1.61 | 0.10 | 2.04 | 0.10 |

(1) This estimate has a very large standard error in relation to its size.

(1) Par rapport à sa taille, l'estimation a une très grande erreur-type.

Source: Refer to Gosselin, J.-F. and Thérout, G., "Basic Results on Population and Household Undercoverage in the 1976 Census" (1976 Census Parametric Evaluation Project, Reverse Record Check), Census Survey Methods Division, Statistical Services Field, Statistics Canada, Ottawa, March 1978.

Source: Voir à ce sujet Gosselin, J.-F. et Thérout, G., "Principaux résultats concernant le sous-dénombrement de la population et des ménages lors du recensement de 1976" (Projet d'évaluation paramétrique, recensement de 1976, Contre-vérification des dossiers), Division des méthodes d'enquêtes-recensement, Secteur des services statistiques, Statistique Canada, Ottawa, mars 1978.

The main response and processing errors stem from non-responses, misinterpretation of questions by the respondents and coding and imputation errors. The response rate for the 1976 Census question on age was 98.4% and on sex 98.6%. For further detail on the total standard error associated with the 1976 Census figures, the publication Catalogue 92-823 may be consulted.

Unfortunately, little accurate information is available on the magnitude of error resulting from estimates of the components of population change. However, on the basis of the quality of the data sources, the components can be divided into two categories: the first consists of births, deaths and immigration, (6) for which the sources can be considered nearly perfect where final data is used, and the second is international emigration and interprovincial migration, for which the method used to estimate the number of emigrants and interprovincial migrants by sex and age may increase the risk of error.

Despite this, given the size of the errors observed at the end of the 1971-1976 intercensal period (see Text Table III), the present postcensal estimates should have an acceptable degree of reliability, if it is assumed that the quality of the basic data remains constant. The reader should be cautious in interpreting these results, as the undercoverage varies from one age group to another and from one census to another. For example, at 15 to 19 years in 1971 the undercoverage rate was 2.71%. In 1976, these persons were 20 to 24 years of age, and their undercoverage rate reached 5.99%.

(6) This refers only to Canada's data on legal immigration, which excludes illegal immigrants and all former residents returning to the country after absences of 12 months or more.

Les principales erreurs de réponse et d'exploitation proviennent des non-réponses, des interprétations erronées de la part des recensés, du codage et de l'imputation. Les taux de réponse aux questions du recensement de 1976 ont été de 98.4 % pour l'âge et de 98.6 % pour le sexe. Pour plus de détails sur l'erreur type totale des chiffres du recensement de 1976, on peut se référer à la publication n° 92-823 au catalogue.

Malheureusement on dispose de peu d'information précise sur l'importance de l'erreur provenant de l'estimation des composantes du mouvement de la population. Cependant, sur la base de la qualité de leurs sources de données, les composantes peuvent être divisées en deux catégories: les naissances, les décès et l'immigration (6) pour lesquelles les sources peuvent être considérées comme presque parfaites lorsqu'il s'agit de données finales et enfin, l'émigration internationale et la migration interprovinciale pour lesquelles les méthodologies utilisées pour estimer les effectifs d'émigrants et de migrants interprovinciaux selon le sexe et l'âge, peuvent accroître les risques d'erreur.

Malgré tout, dans l'hypothèse que la qualité des données de base demeure inchangée, les présentes estimations postcensitaires devraient avoir un niveau de fiabilité acceptable compte tenu des erreurs observées à la fin de la période intercensitaire 1971-1976 du moins au niveau du Canada, voir le tableau explicatif III. Le lecteur devrait être prudent dans l'interprétation de ces résultats car le sous-dénombrement varie d'un groupe d'âges à l'autre et d'un recensement à l'autre. Par exemple à (15 à 19 ans) en 1971, le taux de sous-dénombrement était 2.71 %. En 1976 ces personnes étaient âgées de 20 à 24 ans et leur taux de sous-dénombrement atteignait 5.99 %.

(6) Il ne s'agit que de l'immigration légale. Sont donc exclus les immigrants illégaux, les anciens résidents canadiens revenant au pays après un séjour de 12 mois et plus à l'étranger.

TEXT TABLE III. Error of Closure by Sex and Age Group, Canada, June 1, 1976(1)

(1) This is an error for a five-year period.

$\frac{\text{Estimated population} - \text{Census population}}{\text{Census population}} \times 100$

(1) Il s'agit d'une erreur pour une période de cinq ans.

$\frac{\text{Population estimée} - \text{Population recensée}}{\text{Population recensée}} \times 100$

DEFINITIONS

Population

"Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence...was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily". Dictionary of the 1971 Census Terms, Catalogue 12-540.

Census Year

The census year refers to the period beginning June 1 of a given year and ending May 31 of the following year. June 1 is Census Day.

Number of Complete Years Lived

Age at last birthday.

Birth Cohort

A group of persons born within a given 12-month period, the calendar year in general. Here, unless otherwise indicated, this period will exactly coincide with the census year.

June 1 Postcensal Population Estimate

For a given cohort, this is the estimate which is obtained by taking as a base the size of that cohort as of June 1 in the preceding year, and taking into account the demographic events which affected the cohort since that date.

Interprovincial Migration

Movements from one province to another involving a change in residence. A person who takes up residence in another province is an out-migrant with reference to his province of origin, and an in-migrant with reference to his province of destination.

Error of Closure

Difference between the population according to a census and the final postcensal estimate for the same date.

DÉFINITIONS

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle...était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". Dictionnaire des termes du recensement de 1971, n° 12-540 au catalogue.

Année censitaire

Par référence à la date habituelle du recensement, on a convenu de désigner ainsi la période qui s'étend du 1^{er} juin d'une année au 31 mai suivant.

Âge en années révolues

Âge au dernier anniversaire.

Génération

Ensemble des personnes nées durant une même période de 12 mois, l'année civile en général. Sauf indication contraire, il s'agira ici des individus nés la même année censitaire.

Estimation postcensitaire de la population au 1^{er} juin

Pour une génération donnée, il s'agit de l'estimation obtenue en prenant comme base l'effectif de cette génération au 1^{er} juin de l'année précédente et en tenant compte des événements démographiques survenus depuis cette date.

Migration interprovinciale

Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement de résidence. Un individu qui effectue un tel déplacement sera un sortant pour sa province d'origine et un entrant pour sa province de destination.

Erreur en fin de période intercensitaire

Différence entre la population donnée par un recensement et l'estimation postcensitaire définitive à la date du recensement.

International Migration

Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between immigrants from other countries who settle in Canada and emigrants who leave Canada.

Undercoverage Rate

The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Median Age

An age x, such that exactly one half of the population is older than x and the other half is younger than x.

Sex Ratio or Masculinity Ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Dependency Ratio

Although the total population is usually sub-divided up into the following three broad age groups for children (age 0 to 14), adults (ages 15 to 64), and aged persons (ages 65 and over), for purposes of calculating the various dependency ratios in this report the following age groups have been used: children (ages 0 to 17), adults (ages 18 to 64), and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

child dependency ratio, i.e., the number of children per adult;

aged dependency ratio, i.e., the number of aged persons per adult;

total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

A fourth ratio, the aged-to-child ratio, is sometimes used. It represents the number of aged persons per child.

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement de résidence. On distingue à cet égard les immigrants, qui viennent s'établir au Canada et les émigrants, qui quittent le Canada.

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Âge médian

Âge x tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à x, l'autre des individus d'âge inférieur à x.

Rapport de masculinité

Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

Rapport de dépendance

Bien qu'on a coutume de répartir la population dans les trois grands groupes d'âges: 0 à 14 ans (enfants), 15 à 64 ans (adultes) et 65 ans et plus (personnes âgées), pour calculer les divers rapports de dépendance, nous avons préféré utiliser les groupes d'âges suivants: 0 à 17 ans (enfants), 18 à 64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

le rapport de dépendance des enfants, égal au nombre d'enfants par adulte;

le rapport de dépendance des personnes âgées qui représente le nombre de personnes âgées par adulte;

le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Une autre mesure, le rapport personnes âgées-enfants, est parfois utilisée; elle renseigne sur le nombre de personnes âgées par enfant.

Detailed Tables

Tableaux détaillés

TABLE 1. Postcensal Estimate of the Population by Sex and Age, Canada and Provinces, June 1st 1977 (D)

TABLEAU 1. Estimation postcensitaire de la population selon le sexe et l'âge, Canada et provinces, 1er juin 1977 (D)

Median age (years) - Age médian (années):

| | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 27.5 | 22.9 | 26.3 | 26.7 | 25.5 | 27.3 | 28.2 | 27.6 | 27.3 | 26.1 | 29.1 | 25.5 | 21.2 |
|------|------|------|------|------|------|------|------|------|------|------|------|------|

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

| Median age (years) - Age médian (années): | | | | | | | | | | | | | |
| | 28.2 | 23.1 | 27.0 | 27.4 | 26.1 | 28.1 | 28.9 | 28.3 | 27.7 | 26.3 | 29.5 | 24.8 | 20.7 |

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

Median age (years) - Âge médian (années):

27.8 23.3 26.6 27.1 25.8 27.7 28.5 27.9 27.5 26.4 29.4 25.5 21.1

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(P) : Preliminary estimate.

(P) : Estimation préliminaire.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

This and other government publications may be purchased from local authorized agents and other community bookstores or by mail order.

Mail orders should be sent to Publications Distribution, Statistics Canada, Ottawa, K1A 0T6, or to Publishing Centre, Supply and Services Canada, Ottawa, K1A 0S9.

Inquiries about this publication should be addressed to:

Social Statistics Field,
Demography Division,

Statistics Canada, Ottawa, K1A 0T6 (telephone: 995-2212) or to a local Advisory Services office:

| | |
|--------------------|------------|
| St. John's (Nfld.) | (726-0713) |
| Halifax | (426-5331) |
| Montréal | (283-5725) |
| Ottawa | (992-4734) |
| Toronto | (966-6586) |
| Winnipeg | (949-4020) |
| Regina | (359-5405) |
| Edmonton | (420-3027) |
| Vancouver | (666-3695) |

Toll-free access to the regional statistical information service is provided in Nova Scotia, New Brunswick, and Prince Edward Island by telephoning 1-800-565-7192. Throughout Saskatchewan, the Regina office can be reached by dialing 1-800-667-3524, and throughout Alberta, the Edmonton office can be reached by dialing 1-800-222-6400.

Nota

On peut se procurer cette publication, ainsi que toutes les publications du gouvernement du Canada, auprès des agents autorisés locaux, dans les librairies ordinaires ou par la poste.

Les commandes par la poste devront parvenir à Distribution des publications, Statistique Canada, Ottawa, K1A 0T6, ou à Imprimerie et édition, Approvisionnements et services Canada, Ottawa, K1A 0S9.

Toutes demandes de renseignements sur la présente publication doivent être adressées à:

Secteur de la statistique sociale,
Division de la démographie,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 995-2212) ou à un bureau local des Services consultatifs situé aux endroits suivants:

| | |
|--------------------|------------|
| St. John's (T.-N.) | (726-0713) |
| Halifax | (426-5331) |
| Montréal | (283-5725) |
| Ottawa | (992-4734) |
| Toronto | (966-6586) |
| Winnipeg | (949-4020) |
| Regina | (359-5405) |
| Edmonton | (420-3027) |
| Vancouver | (666-3695) |

On peut obtenir une communication gratuite avec le service régional d'information statistique de la Nouvelle-Écosse, du Nouveau-Brunswick et de l'Île-du-Prince-Édouard en composant 1-800-565-7192. En Saskatchewan, on peut communiquer avec le bureau régional de Regina en composant 1-800-667-3524, et en Alberta, avec le bureau d'Edmonton au numéro 1-800-222-6400.

Estimates of population by sex and age for Canada and the provinces

June 1, 1979

The final postcensal estimates for June 1, 1978 that are contained in this publication replace the preliminary estimates that were published in the previous edition of this bulletin in May 1980

Estimations de la population selon le sexe et l'âge, Canada et provinces

1^{er} juin 1979

Les estimations postcensitaires définitives au 1^{er} juin 1978 contenues dans la présente publication remplacent les estimations provisoires parues dans l'édition de mai 1980 de ce bulletin

INTRODUCTION

For years other than census years, Statistics Canada publishes regularly postcensal estimates of the total population by age and sex as of June 1, which are calculated on the basis of the results of the preceding census.

This publication contains preliminary postcensal estimates of the population by sex and age as of June 1, 1979, and final postcensal estimates by sex and age as of June 1, 1978. These latter estimates replace the preliminary estimates for 1978 that were published in the previous edition of this publication.

It should be noted that, in the past, Statistics Canada published only one series of postcensal estimates by age and sex. Beginning with June 1, 1977, two series of postcensal estimates are published: preliminary postcensal estimates and final postcensal estimates. The final postcensal estimates will be revised at a later date in light of the results of the 1981 Census in order to provide intercensal population estimates (formerly called "revised estimates") by age and sex. Catalogue 91-512, Occasional (July 1973) and Catalogue 91-518, Occasional (March 1979) contain the intercensal estimates for the periods 1921-1971 and 1971-1976 respectively.

Methodology

The final postcensal estimates for June 1, 1978 contained herein were obtained by the component method, using the June 1, 1977 final postcensal estimates as the base population.

The demographic events that were experienced during the 12-month period commencing June 1, 1977 by each cohort, which is defined here as the total number of persons born during a given census year, were compiled as follows: (the June 1, 1977 estimated population plus total immigrants) minus (total deaths plus total emigrants). The same mathematical procedure is applied to individuals born during the period of June 1, 1977 to May 31, 1978, who therefore would have lived less than one complete year by June 1, 1978. It is also necessary to add the interprovincial net migration experienced by each province; obviously, the net migration gains and losses sum to zero at the national level. This produces a final postcensal estimate for each age or age group and each sex as of June 1, 1978.

INTRODUCTION

Sauf pour les années de recensement, Statistique Canada publie régulièrement des estimations postcensitaires de la population selon le sexe et l'âge au 1^{er} juin, calculées à partir des résultats du dernier recensement.

Cette publication présente les estimations postcensitaires provisoires de la population selon le sexe et l'âge au 1^{er} juin 1979, ainsi que les estimations postcensitaires définitives au 1^{er} juin 1978, qui remplacent celles parues en mai 1980.

Il faut noter que, dans le passé, Statistique Canada ne publiait qu'une série d'estimations postcensitaires selon le sexe et l'âge. À compter du 1^{er} juin 1977, on dispose de deux séries d'estimations postcensitaires publiées: les estimations postcensitaires provisoires et les postcensitaires définitives. Ces dernières seront révisées à la lumière des résultats du recensement de 1981 pour donner lieu à des estimations intercensitaires (anciennement "estimations révisées") de la population selon le sexe et l'âge. Les publications hors série nos 91-512 (juillet 1973) et 91-518 (mars 1979) au catalogue présentent ces estimations intercensitaires pour les périodes 1921-1971 et 1971-1976 respectivement.

Méthodologie

Les estimations postcensitaires définitives au 1^{er} juin 1978, obtenues par la méthode des composantes, ont comme point de départ l'estimation postcensitaire définitive au 1^{er} juin 1977.

Ainsi, pour chaque génération, définie ici comme l'ensemble des personnes nées au cours d'une même année censitaire, on a tenu compte des événements démographiques survenus durant la période de 12 mois commençant le 1^{er} juin 1977. À l'effectif estimé à cette date on a donc ajouté le nombre des immigrants, puis on en a retranché le nombre des décès et des émigrants. La même comptabilité est appliquée aux individus nés durant la période du 1^{er} juin 1977 au 31 mai 1978 et qui auront donc moins de un an le 1^{er} juin 1978. Pour chaque province, il faut en outre ajouter le solde migratoire interprovincial, celui-ci étant évidemment nul au niveau national. On aboutit ainsi, pour chaque âge ou groupe d'âges et chacun des sexes, à une estimation postcensitaire définitive au 1^{er} juin 1978.

The same method was employed to produce the preliminary postcensal estimates for June 1, 1979, except that in this case the 1978 final postcensal estimates were used as the base population.

Data Sources

The components of population change are estimated on the basis of data gleaned from the various sources listed in Text Table I.

Les estimations postcensitaires provisoires de la population au 1^{er} juin 1979, sont obtenues par la même méthode que celle décrite ci-dessus, mais elles ont comme point de départ les estimations postcensitaires définitives du 1^{er} juin 1978.

Sources des données

Les composantes sont estimées à l'aide de diverses sources figurant au tableau explicatif I.

The following section examines the age and sex structure of the population in the four Western provinces as of June 1st, 1979.

Sex Structure

In Alberta and Saskatchewan, there are 103 and 102 men respectively per 100 women, whereas the ratio in Manitoba (99) and British Columbia (98) approximates the national average. For every age group up to and including 45 to 49, the male-to-female ratios exceed 100 in all four provinces. They fall off rapidly thereafter, to lows of 56 in Manitoba, 58 in British Columbia, and 67 in the two remaining provinces for the 90 and over age group. This progressive decrease of the sex ratio after age 50, which is attributable to excess mortality among men, is referred to as the age factor. Another factor to be considered is the cohort effect. Indeed, each cohort of men and women has its own history, and some male cohorts are more heavily affected than their female counterparts by mortality and emigration.

Age Structure

Figure I shows the age pyramids of the population for the four Western provinces and for Canada as of June 1st, 1979. Because of differences in size, all populations were reduced to 100,000 for purposes of comparison. The triangular shape of the four Western pyramids closely resembles that of the Canada pyramid and stems both from the effects of mortality, which progressively reduces the size of successive age categories, and from the cohort effect on the age structure determined as of June 1st, 1979. Each age pyramid in this figure contains irregularities corresponding to certain cohort groups: indentations characterize the 1927 to 1938 cohorts, protrusions the 1938 to 1963 cohorts, and a narrowing at the base for the 1963 to 1979 cohorts; these irregularities match those found on the Canada pyramid, which were discussed in the November 1978 issue of this publication.

British Columbia has, in relative terms, the fewest number of young people between the ages of zero and 19, because of its low fertility. Saskatchewan, on the other hand, has the lowest proportion of persons in the 15 to 44 five-year age groups; this situation is a result of emigration from 1960 to 1973. After the age of 45, the pyramids of Manitoba, Alberta, and Saskatchewan are almost identical.

La présente partie traitera de la structure selon le sexe et l'âge au 1^{er} juin 1979 de la population des quatre provinces à l'ouest de l'Ontario.

La structure selon le sexe

En Alberta et en Saskatchewan on compte respectivement 103 et 102 hommes pour 100 femmes alors qu'au Manitoba et en Colombie-Britannique ce rapport est de 99 et 98 soit approximativement celui observé au Canada. Pour tous les groupes d'âges de zéro à quatre ans jusqu'à celui de 45 à 49 ans les rapports de masculinité sont supérieurs à 100 dans ces quatre provinces. À compter de 50 ans ces rapports diminuent rapidement atteignant pour la groupe d'âges 90 ans et plus 56 au Manitoba, 58 en Colombie-Britannique et 67 dans les deux autres provinces. Cette baisse du rapport de masculinité après 50 ans au fur et à mesure que l'on avance en âge et attribuable à la surmortalité masculine, c'est l'effet d'âge. À cet effet peut s'ajouter l'effet de génération: chaque génération d'hommes et de femmes ayant sa propre histoire certaines générations masculines ont pu être touchées plus durement que les mêmes générations féminines par la mortalité et l'émigration.

La structure selon l'âge

La figure I représente la pyramide des âges de la population des quatre provinces de l'Ouest et du Canada au 1^{er} juin 1979. Les effectifs de population étant différents, nous les avons ramenés, pour fins de comparaison, à une même population totale de 100,000. Ces quatre pyramides épousent une forme triangulaire très similaire à celle du Canada et résultant d'une part de l'action de la mortalité qui réduit les effectifs de chaque génération au fur et à mesure qu'on avance en âge et d'autre part de l'effet de génération qui a pu influencer sur la structure par âge observée au 1^{er} juin 1979. Sur chaque pyramide d'âge de ce graphique, nous observons, pour les mêmes groupes de générations, des encoches (générations 1927 à 1938), des gonflements (générations 1938 à 1963) et un rétrécissement à la base (générations 1963 à 1979) similaires à ceux observés sur la pyramide du Canada et discutés dans l'édition de cette publication parue en novembre 1978.

Si d'une part la Colombie-Britannique est la province qui compte proportionnellement le moins de gens entre zéro et 19 ans (résultat de sa faible fécondité), c'est en Saskatchewan que l'on retrouve les plus faibles proportions de personnes pour les groupes quinquennaux d'âges de 15 à 44 ans: situation explicable par l'émigration des années 1960 à 1973. Toutefois à compter de 45 ans les pyramides du Manitoba, de l'Alberta et de la Saskatchewan ont un profil quasi identique.

Finally, a superimposition of the Alberta and British Columbia pyramids points up significant discrepancies in the base (ages zero to 29) and in the upper area (ages 50 years and over). The relatively wide base of the Alberta pyramid can be attributed to higher fertility in that province, even though the effects of the general decline in fertility over the last 16 years are also evident. The narrowing of Alberta's pyramid after age 50 could be partly due to immigration in previous years, but it is mainly typical of a young age structure.

Broad Age Groups

In order to better assess the degree of ageing in the populations being studied, we shall examine, for 1961 and 1979, their distributions by broad age groups: children (zero to 17 years), working age adults (18 to 64 years), and the elderly (65 years and over). The population of Manitoba and Saskatchewan are ageing from the bottom up; in other words, the proportion of elderly people is increasing because the number of persons under 18 years is decreasing, as the following table illustrates:

Enfin la superposition des pyramides de l'Alberta et de la Colombie-Britannique met en évidence des différences importantes à leur base (zéro à 29) et aussi à leur partie supérieure (50 ans ou plus). Une plus forte fécondité des Albertaines explique la forme relativement large de la base de sa pyramide, même si on y discerne aussi les effets de la baisse générale de la fécondité des 16 dernières années. Quant à la forme plus effilée de la pyramide de l'Alberta à compter de 50 ans, elle peut être en partie attribuable à l'immigration des années antérieures, mais elle est surtout typique des populations à structure jeune.

Les grands groupes d'âges

Afin de mieux juger du degré de vieillissement des populations en cause, nous examinerons la répartition des populations par grands groupes d'âges: enfants (zéro à 17 ans), adultes (18 à 64 ans) et personnes âgées (65 ans ou plus) en 1961 et 1979. Le Manitoba et la Saskatchewan sont engagés dans un processus de vieillissement par la base, caractérisé par une augmentation de la proportion des gens âgés, résultant de la diminution des effectifs des moins de 18 ans tel que l'illustre le tableau ci-dessous:

| Province | Percentage of population aged 0-17 years | | Percentage of population aged 18-64 years | | Percentage of population aged 65 years and over | |
|--------------------------------------------|-----------------------------------------------------|------|------------------------------------------------------|------|-----------------------------------------------------------|------|
| | Pourcentage de la population âgée de 0-17 ans | | Pourcentage de la population âgée de 18-64 ans | | Pourcentage de la population âgée de 65 ans ou plus | |
| | 1961 | 1979 | 1961 | 1979 | 1961 | 1979 |
| Manitoba | 37.4 | 29.9 | 53.6 | 58.9 | 9.0 | 11.2 |
| Saskatchewan | 39.0 | 31.3 | 51.7 | 57.2 | 9.3 | 11.5 |
| Alberta | 39.9 | 31.4 | 53.1 | 61.0 | 7.0 | 7.6 |
| British Columbia - Colombie-Britannique | 35.6 | 27.8 | 54.2 | 61.7 | 10.2 | 10.5 |
| Canada | 38.9 | 29.5 | 53.5 | 61.2 | 7.6 | 9.3 |

One can hardly speak of ageing in Alberta and British Columbia, since the ratio of elderly persons barely rose from 1961 to 1979. Moreover, the number of children has increased, although in relative terms persons under 18 represented only 31% of the population in Alberta and 28% in British Columbia

En Alberta et en Colombie-Britannique on peut difficilement parler de vieillissement de la population puisque la proportion des 65 ans et plus a très peu augmenté entre 1961 et 1979. De plus les effectifs des moins de 18 ans se sont accrus bien que leur proportion en 1979 ne représente plus que 31 % en Alberta et 28 % en Colombie-Britannique

in 1979, compared with 40% and 36% respectively in 1961. This downward movement has come about because the growth of the adult population has outpaced that of the under-18-year-olds. The relative increase in the number of adults is probably due to the immigration of young people, which compensates for the decline in the birthrate. Between 1961 and 1979, total net migration gains reached 257,758 for Alberta and 514,000 for British Columbia, whereas the two other provinces recorded total net migration losses of 74,000 to 166,000.

Dependency Ratios

The various dependency ratios (for children, for the aged, and the total ratio) also serve as useful indicators since they provide information on the economic burden that is borne by the adult population. The total dependency ratio in Canada declined from 0.871 dependents per adult in 1961 to 0.634 in 1979, a drop of 27%. Over the same period, the total dependency ratios of Alberta and British Columbia decreased a little more rapidly (26%) than those of Manitoba and Saskatchewan (20%):

contre 40 % et 36 % en 1961. Cette diminution de la proportion des enfants provient d'un accroissement plus rapide surtout des effectifs de la population adulte que de ceux des enfants. Cet accroissement relatif des effectifs des adultes est sans doute attribuable à l'immigration qui enrichit la population d'éléments jeunes qui compensent les effets de la baisse de la natalité. Soulignons qu'entre 1961 et 1979 le solde migratoire total en Alberta s'établit à 257,758 et celui de la Colombie-Britannique à 514,000, tandis que les deux autres provinces enregistraient des pertes nettes de 74,000 et 166,000.

Les rapports de dépendance

Les divers rapports de dépendance, celui des enfants, celui des personnes âgées ainsi que le rapport global ou total sont d'autres indices utiles à considérer puisqu'ils nous renseignent sur le fardeau économique que doivent supporter les adultes. Entre 1961 et 1979, le rapport global de dépendance au Canada est passé de 0.871 à 0.634 personne à charge par adulte, soit une diminution de 27 %. Au cours de la même période, les rapports globaux de dépendance de l'Alberta et de la Colombie-Britannique ont diminué un peu plus rapidement (26 %), que ceux du Manitoba et de la Saskatchewan (20 %):

| Province | Total dependency ratio | | Children dependency ratio | | Aged dependency ratio | |
|-----------------------------------------|------------------------------------|-------|-----------------------------------------|-------|----------------------------------------------------|-------|
| | Rapport global de dépendance | | Rapport de dépendance des enfants | | Rapport de dépendance des personnes âgées | |
| | 1961 | 1979 | 1961 | 1979 | 1961 | 1979 |
| Manitoba | 0.867 | 0.698 | 0.698 | 0.508 | 0.169 | 0.190 |
| Saskatchewan | 0.934 | 0.750 | 0.755 | 0.548 | 0.179 | 0.202 |
| Alberta | 0.882 | 0.640 | 0.751 | 0.515 | 0.131 | 0.125 |
| British Columbia - Colombie-Britannique | 0.845 | 0.622 | 0.657 | 0.451 | 0.188 | 0.171 |
| Canada | 0.871 | 0.634 | 0.727 | 0.482 | 0.142 | 0.152 |

Consequently, the burden born by the adult population of these provinces was approximately 23% lighter in 1979 than in 1961.

However, a breakdown of the total dependency ratio into ratios for children and the aged shows that the decline of the total ratio in Manitoba and Saskatchewan from 1961 to 1979 is entirely due to a decrease of about 27% in the child dependency ratio, since the aged dependency ratio increased by 19% in Manitoba and by less than 13% in Saskatchewan. In contrast, Alberta and British Columbia recorded lower ratios in 1979 than in 1961 not only for the child dependency ratios (- 27% and - 31% respectively), but also for the aged dependency ratios (- 9% and - 5% respectively).

Quality of Estimates

The postcensal estimates contained in this publication have a certain margin of inaccuracy deriving both from the margin of error for 1976 Census data, which are used as the basis for the present postcensal estimates, and from errors due to the methods of estimating the components.

Among the errors which may originate with census data are coverage errors and response and processing errors. Coverage errors are caused primarily by undercoverage, since overcoverage is so rare as to be considered negligible. For Canada as a whole, the overall undercoverage rate for the 1976 Census was approximately 2%. The rate varies not only from one province to another but also by sex and age as shown in Text Table II.

The main response and processing errors stem from non-responses, misinterpretation of questions by the respondents and coding and imputation errors. The response rate for the 1976 Census question on age was 98.4% and on sex 98.6%. For further detail on the total standard error associated with the 1976 Census figures, the publication Catalogue 92-823 may be consulted.

Par conséquent le fardeau des adultes dans ces provinces en 1979 s'est allégé en moyenne d'environ 23 % par rapport à celui de 1961.

Toutefois, une décomposition du rapport global de dépendance en rapport de dépendance des personnes âgées et en rapport de dépendance des enfants, nous permet de constater que la diminution du rapport global observée au Manitoba et en Saskatchewan entre 1961 et 1979 est attribuable uniquement à une baisse du rapport de dépendance des enfants de 1961 d'environ 27 %, celui des personnes âgées s'étant accru de 19 % au Manitoba et de moins de 13 % en Saskatchewan. Par contre, en Alberta et en Colombie-Britannique, non seulement les rapports de dépendance des enfants en 1979 sont inférieurs à ceux de 1961 (- 27 % et - 31 %) mais aussi ceux des personnes âgées (- 9 % et - 5 %).

Qualité des estimations

Les estimations postcensitaires contenues dans la présente publication sont entachées d'une certaine marge d'imprécision qui provient à la fois des marges d'erreur des données du recensement de 1976, population de départ des présentes estimations postcensitaires et des erreurs dues aux méthodologies d'estimation des composantes.

Parmi les erreurs imputables aux données du recensement, on retrouve les erreurs de couverture et les erreurs de réponse et d'exploitation. Les erreurs de couverture sont principalement causées par le sous-dénombrement. Le surdénombrement étant assez rare, il est considéré comme négligeable. Au niveau du Canada, le taux global de sous-dénombrement lors du recensement de 1976 fut d'environ 2 %. L'importance du taux varie non seulement d'une province à l'autre mais aussi selon le sexe et l'âge tel qu'indiqué au tableau explicatif II.

Les principales erreurs de réponse et d'exploitation proviennent des non-réponses, des interprétations erronées de la part des recensés, du codage et de l'imputation. Les taux de réponse aux questions du recensement de 1976 ont été de 98.4 % pour l'âge et de 98.6 % pour le sexe. Pour plus de détails sur l'erreur type totale des chiffres du recensement de 1976, on peut se référer à la publication n° 92-823 au catalogue.

(1) This estimate has a very large standard error in relation to its size.

(1) Par rapport à sa taille, l'estimation a une très grande erreur-type.

Source: 1976 Census of Canada, Quality of Data, Series 1: Sources of Error-Coverage, Catalogue 99-840, page 31, Statistics Canada, Ottawa, March 1980.

Source: Recensement du Canada de 1976, Qualité des données, série 1: Sources d'erreurs-couverture, n° 99-840 au catalogue, page 31, Statistique Canada, Ottawa, mars 1980.

Unfortunately, little accurate information is available on the magnitude of error resulting from estimates of the components of population change. However, on the basis of the quality of the data sources, the components can be divided into two categories: the first consists of births, deaths and immigration, (1) for which the sources can be considered nearly perfect where final data is used, and the second is international emigration and interprovincial migration, for which the method used to estimate the number of emigrants and interprovincial migrants by sex and age may increase the risk of error.

Malheureusement on dispose de peu d'information précise sur l'importance de l'erreur provenant de l'estimation des composantes du mouvement de la population. Cependant, sur la base de la qualité de leurs sources de données, les composantes peuvent être divisées en deux catégories: les naissances, les décès et l'immigration (1) pour lesquelles les sources peuvent être considérées comme presque parfaites lorsqu'il s'agit de données finales et enfin, l'émigration internationale et la migration interprovinciale pour lesquelles les méthodologies utilisées pour estimer les effectifs d'émigrants et de migrants interprovinciaux selon le sexe et l'âge, peuvent accroître les risques d'erreur.

(1) This refers only to Canada's data on legal immigration, which excludes illegal immigrants and all former residents returning to the country after absences of 12 months or more.

(1) Il ne s'agit que de l'immigration légale. Sont donc exclus les immigrants illégaux, les anciens résidents canadiens revenant au pays après un séjour de 12 mois et plus à l'étranger.

Despite this, given the size of the errors observed at the end of the 1971-1976 intercensal period (see Text Table III), the present postcensal estimates should have an acceptable degree of reliability, if it is assumed that the quality of the basic data remains constant. The reader should be cautious in interpreting these results, as the undercoverage varies from one age group to another and from one census to another. For example, at 15 to 19 years in 1971 the undercoverage rate was 2.71%. In 1976, these persons were 20 to 24 years of age, and their undercoverage rate reached 5.99%.

Malgré tout, dans l'hypothèse que la qualité des données de base demeure inchangée, les présentes estimations postcensitaires devraient avoir un niveau de fiabilité acceptable compte tenu des erreurs observées à la fin de la période intercensitaire 1971-1976 du moins au niveau du Canada, voir le tableau explicatif III. Le lecteur devrait être prudent dans l'interprétation de ces résultats car le sous dénombrement varie d'un groupe d'âges à l'autre et d'un recensement à l'autre. Par exemple à (15 à 19 ans) en 1971, le taux de sous dénombrement était 2.71 %. En 1976 ces personnes étaient âgées de 20 à 24 ans et leur taux de sous dénombrement atteignait 5.99 %.

(1) This is an error for a five-year period.

$$\frac{\text{Estimated population} - \text{Census population}}{\text{Census population}} \times 100$$

(1) Il s'agit d'une erreur pour une période de cinq ans.

$$\frac{\text{Population estimée} - \text{Population recensée}}{\text{Population recensée}} \times 100$$

DEFINITIONS

Population

"Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence...was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily". Dictionary of the 1971 Census Terms, Catalogue 12-540.

Census Year

The census year refers to the period beginning June 1 of a given year and ending May 31 of the following year. June 1 is Census Day.

Number of Complete Years Lived

Age at last birthday.

Birth Cohort

A group of persons born within a given 12-month period, the calendar year in general. Here, unless otherwise indicated, this period will exactly coincide with the census year.

June 1 Postcensal Population Estimate

For a given cohort, this is the estimate which is obtained by taking as a base the size of that cohort as of June 1 in the preceding year, and taking into account the demographic events which affected the cohort since that date.

Interprovincial Migration

Movements from one province to another involving a change in residence. A person who takes up residence in another province is an out-migrant with reference to his province of origin, and an in-migrant with reference to his province of destination.

Error of Closure

Difference between the population according to a census and the final postcensal estimate for the same date.

DÉFINITIONS

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle...était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". Dictionnaire des termes du recensement de 1971, n° 12-540 au catalogue.

Année censitaire

Par référence à la date habituelle du recensement, on a convenu de désigner ainsi la période qui s'étend du 1^{er} juin d'une année au 31 mai suivant.

Âge en années révolues

Âge au dernier anniversaire.

Génération

Ensemble des personnes nées durant une même période de 12 mois, l'année civile en général. Sauf indication contraire, il s'agira ici des individus nés la même année censitaire.

Estimation postcensitaire de la population au 1^{er} juin

Pour une génération donnée, il s'agit de l'estimation obtenue en prenant comme base l'effectif de cette génération au 1^{er} juin de l'année précédente et en tenant compte des événements démographiques survenus depuis cette date.

Migration interprovinciale

Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement de résidence. Un individu qui effectue un tel déplacement sera un sortant pour sa province d'origine et un entrant pour sa province de destination.

Erreur en fin de période intercensitaire

Différence entre la population donnée par un recensement et l'estimation postcensitaire définitive à la date du recensement.

International Migration

Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between immigrants from other countries who settle in Canada and emigrants who leave Canada.

Undercoverage Rate

The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Median Age

An age x, such that exactly one half of the population is older than x and the other half is younger than x.

Sex Ratio or Masculinity Ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Dependency Ratio

Although the total population is usually sub-divided up into the following three broad age groups for children (ages zero to 14), adults (ages 15 to 64), and aged persons (ages 65 and over), for purposes of calculating the various dependency ratios in this report the following age groups have been used: children (ages zero to 17), adults (ages 18 to 64), and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

child dependency ratio, i.e., the number of children per adult;

aged dependency ratio, i.e., the number of aged persons per adult;

total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

A fourth ratio, the aged-to-child ratio, is sometimes used. It represents the number of aged persons per child.

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement de résidence. On distingue à cet égard les immigrants, qui viennent s'établir au Canada et les émigrants, qui quittent le Canada.

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Âge médian

Âge x tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à x, l'autre des individus d'âge inférieur à x.

Rapport de masculinité

Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

Rapport de dépendance

Bien qu'on a coutume de répartir la population dans les trois grands groupes d'âges: zéro à 14 ans (enfants), 15 à 64 ans (adultes) et 65 ans et plus (personnes âgées), pour calculer les divers rapports de dépendance, nous avons préféré utiliser les groupes d'âges suivants: zéro à 17 ans (enfants), 18 à 64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

le rapport de dépendance des enfants, égal au nombre d'enfants par adulte;

le rapport de dépendance des personnes âgées qui représente le nombre de personnes âgées par adulte;

le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Une autre mesure, le rapport personnes âgées-enfants, est parfois utilisée; elle renseigne sur le nombre de personnes âgées par enfant.

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

| | 28.1 | 23.8 | 27.0 | 27.4 | 26.3 | 28.1 | 28.8 | 28.2 | 27.8 | 26.6 | 29.7 | 25.5 | 20.8 |

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(P) : Preliminary estimate.

(P) : Estimation préliminaire.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

INTRODUCTION

For years other than census years, Statistics Canada published regularly **postcensal** estimates of the total population by age and sex as of June 1, which are calculated on the basis of the results of the preceding census.

This publication contains **preliminary postcensal** estimates of the population by sex and age as of June 1, 1980, and **final postcensal** estimates by sex and age as of June 1, 1979. These latter estimates replace the preliminary estimates for 1979 that were published in the previous edition of this publication.

It should be noted that, in the past, Statistics Canada published only one series of postcensal estimates by age and sex. Beginning with June 1, 1977, two series of postcensal estimates are published: **preliminary** postcensal estimates and **final** postcensal estimates. The final postcensal estimates will be revised at a later date in light of the results of the 1981 Census in order to provide **intercensal** population estimates (formerly called "revised estimates") by age and sex. Catalogue 91-512, Occasional (July 1973) and Catalogue 91-518, Occasional (March 1979) contain the intercensal estimates for the periods 1921-1971 and 1971-1976 respectively.

Methodology

The final postcensal estimates for June 1, 1979 contained herein were obtained by the component method, using the June 1, 1978 final postcensal estimates as the base population.

The demographic events that were experienced during the 12-month period commencing June 1, 1978 by each cohort, which is defined here as the total number of persons born during a given census year, were compiled as follows: (the June 1, 1978 estimated population plus total immigrants) minus (total deaths plus total emigrants). The same mathematical procedure is applied to individuals born during the period of June 1, 1978 to May 31, 1979, who therefore would have lived less than one complete year by June 1, 1979. It is also necessary to add the interprovincial net migration experienced by each province; obviously, the net migration gains and losses sum to zero at the national level. This produces a final postcensal estimate for each age or age group and each sex as of June 1, 1979.

INTRODUCTION

Sauf pour les années de recensement, Statistique Canada publie régulièrement des estimations **postcensitaires** de la population selon le sexe et l'âge au 1^{er} juin, calculées à partir des résultats du dernier recensement.

Cette publication présente les estimations **postcensitaires provisoires** de la population selon le sexe et l'âge au 1^{er} juin 1980, ainsi que les estimations **postcensitaires définitives** au 1^{er} juin 1979, qui remplacent celles parues en septembre 1980.

Il faut noter que, dans le passé, Statistique Canada ne publiait qu'une série d'estimations postcensitaires selon le sexe et l'âge. À compter du 1^{er} juin 1977, on dispose de deux séries d'estimations postcensitaires publiées: les estimations postcensitaires **provisoires** et les postcensitaires **définitives**. Ces dernières seront révisées à la lumière des résultats du recensement de 1981 pour donner lieu à des estimations **intercensitaires** (anciennement "estimations révisées") de la population selon le sexe et l'âge. Les publications hors série n^{os} 91-512 (juillet 1973) et 91-518 (mars 1979) au catalogue présentent ces estimations intercensitaires pour les périodes 1921-1976 respectivement.

Méthodologie

Les estimations postcensitaires définitives au 1^{er} juin 1979, obtenues par la méthode des composantes, ont comme point de départ l'estimation postcensitaire définitive au 1^{er} juin 1978.

Ainsi, pour chaque génération, définie ici comme l'ensemble des personnes nées au cours d'une même année censitaire, on a tenu compte des événements démographiques survenus durant la période de 12 mois commençant le 1^{er} juin 1978. À l'effectif estimé à cette date on a donc ajouté le nombre des immigrants, puis on en a retranché le nombre des décès et des émigrants. La même comptabilité est appliquée aux individus nés durant la période du 1^{er} juin 1978 au 31 mai 1979 et qui auront donc moins de un an le 1^{er} juin 1979. Pour chaque province, il faut en outre ajouter le solde migratoire interprovincial, celui-ci étant évidemment nul au niveau national. On aboutit ainsi, pour chaque âge ou groupe d'âges et chacun des sexes, à une estimation postcensitaires définitive au 1^{er} juin 1979.

The same method was employed to produce the preliminary postcensal estimates for June 1, 1980 except that in this case the 1979 final postcensal estimates were used as the base population.

Data Sources

The components of population change are estimated on the basis of data gleaned from the various sources listed in Text Table I.

Les estimations postcensitaires provisoires de la population au 1^{er} juin 1980, sont obtenues par la même méthode que celle décrite ci-dessus, mais elles ont comme point de départ les estimations postcensitaires définitives du 1^{er} juin 1979.

Sources des données

Les composantes sont estimées à l'aide de diverses sources figurant au tableau explicatif I.

HIGHLIGHTS

Sex Structure

In Quebec and in Ontario, there are 98 males per 100 females; the ratio in Canada is 99. About 105 boys are born per 100 girls, but this male advantage decreases slowly with age due to excess mortality among males. The ratio drops below 100 for good towards the age of 50 in Canada and Ontario and at age 40 in Quebec.

After the age of 40, the sex ratio of Quebec is consistently lower than those of Ontario and Canada, except in the oldest ages, where it is the Ontario ratio that diverges from those of Canada and Quebec. Canada and Quebec have sex ratios of 52 and about 48 in the 85-89 and 90 and over age groups respectively, as compared with the very low ratios of 44 and 39 for Ontario.

Age Structure

Figure I shows the age pyramids of the population for Canada, Quebec and Ontario as of June 1, 1980. Because of differences in size, all populations were reduced to 100,000 for purposes of comparison. The shape of the pyramids of the two most populous provinces resembles that of the Canada pyramid, a shape which stems both from the effects of mortality, which progressively reduces the size of successive age categories, and from the cohort effect on the age structure determined as of June 1, 1980.

Each age pyramid of the two provinces in this figure contains irregularities corresponding to certain cohort groups: indentations characterize the 1927-1938 cohorts, protrusions the 1938-1963 cohorts, and a narrowing at the base the 1963-1980 cohorts. These irregularities resemble those found on the Canada pyramid, which were discussed in the November 1978 issue of this publication. Also worthy of note is the increasingly obvious broadening at the base of the Canada and Quebec pyramids, a consequence of the coming of reproductive age of the numerous 1946-1960 "baby boom" cohorts.

The similarities between the pyramids are indicative of similar age structures. In fact, since the Quebec and Ontario structures are similar, and since these two provinces accounted for over 3/5 (62.2%) of Canada's total population as of June 1, 1980, it is logical for the Canada structure to resemble them.

FAITS SAILLANTS

Structure selon le sexe

Au Québec et en Ontario on compte 98 hommes pour 100 femmes; le rapport au Canada est de 99. Il naît environ 105 garçons pour 100 filles, mais cet avantage masculin décroît lentement avec l'âge à cause de la surmortalité des hommes. Au Canada et en Ontario, le rapport devient définitivement inférieur à 100 vers l'âge de 50 ans, mais au Québec, il le devient dès l'âge de 40 ans.

Après l'âge de 40 ans, le Québec a un rapport de masculinité toujours inférieur à celui de l'Ontario et du Canada, sauf aux limites de la vie humaine où, au contraire, c'est l'Ontario qui se détache du Canada et du Québec. À 85-89 ans et 90 ans et plus, on retrouve au Canada et au Québec des rapports respectifs de 52 et environ 48; alors qu'en Ontario ces rapports sont très bas, soit 44 et 39.

Structure selon l'âge

La figure I représente la pyramide des âges de la population du Canada, du Québec et de l'Ontario au 1^{er} juin 1980. Les effectifs de population étant différents, nous les avons ramenés, pour fins de comparaison, à une même population totale de 100,000. Les pyramides des deux provinces les plus peuplées épousent une forme semblable à celle du Canada, forme qui résulte d'une part de l'action de la mortalité qui réduit les effectifs de chaque génération au fur et à mesure qu'on avance en âge, et d'autre part de l'effet de génération qui a pu influencer sur la structure par âge observée au 1^{er} juin 1980.

Sur chaque pyramide des âges des deux provinces de ce graphique, nous observons, pour les mêmes groupes de générations, des encoches (générations 1927 à 1938), des gonflements (générations 1938 à 1963) et un rétrécissement à la base (générations 1963 à 1980) similaires à ceux observés sur la pyramide du Canada et discutés dans l'édition de cette publication parue en novembre 1978. Il convient également de noter l'élargissement de plus en plus perceptible de la base de la pyramide pour le Canada et le Québec, une conséquence de l'arrivée à l'âge de la fécondité des générations nombreuses du "baby boom" des années 1946 à 1960.

Les similitudes entre les pyramides dénotent des structures d'âges très semblables. De fait, les structures du Québec et de l'Ontario étant semblables, et ces deux provinces formant plus des 3/5 (62.2%) de la population totale du Canada au 1^{er} juin 1980, il est normal que la structure canadienne ressemble aux leurs.

Quebec has a slightly younger age structure than its Ontarian neighbour. Ontario has a larger proportion of old persons in the over 40 age group, whereas Quebec has a larger proportion of young adults in the 20-40 age group. The trough in the 5-9 age group on the Quebec pyramid corresponds to the significant decline in the birth rate, which reached a low in 1973-74. The broadening at the base of this same pyramid stems primarily from the coming of reproductive age of the numerous "baby boom" cohorts; moreover, the total fertility rate rose from 1.657 in 1974 to 1.748 five years later, while declining steadily in Ontario, to 1.666 in 1979. The Canada age pyramid lies midway between those of the two provinces.

La structure par âge québécoise est légèrement plus jeune que celle de sa voisine ontarienne: aux âges supérieurs à 40 ans, la proportion des personnes âgées est plus élevée en Ontario; à l'inverse, de 20 à 40 ans, c'est au Québec qu'il y a proportionnellement plus de jeunes adultes. Aux âges de 5 à 9 ans, il y a au Québec un creux correspondant à la forte dénatalité qui a atteint un niveau minimal vers 1973-74. La reprise à la base de la même pyramide, résulte surtout de l'arrivée à l'âge de la fécondité des générations nombreuses du "baby boom", de plus, l'indice synthétique de fécondité est passé de 1.657 en 1974 à 1.748 cinq ans plus tard, alors qu'en Ontario cet indice ne cesse de chuter, atteignant 1.666 en 1979. La pyramide des âges canadienne se situe à une position mitoyenne des deux provinces.

Broad Age Groups

In order to better assess the degree of aging in the populations under study, we shall examine, for 1961 and 1980, their distribution by broad age groups: children (0-17 years), adults (18-64 years) and old

Les grands groupes d'âges

Afin de mieux juger du degré de vieillissement des populations en cause, nous examinons leur répartition par grands groupes d'âges: enfants (0 à 17 ans), adultes (18 à 64 ans) et personnes âgées (65 ans ou plus) en 1961 et 1980. Le

persons (65 years or over). The populations of Canada, Quebec and Ontario are aging from the bottom up; in other words, the proportion of elderly people is increasing because the number of persons under 18 years of age is decreasing (except for a slight increase in Ontario), as Text Table II illustrates.

As of June 1, 1980, there was little difference between the broad age groups of Canada, Ontario and Quebec. Where differences do exist is in the evolution of the populations since 1961. Between 1961 and 1980, the median age, which is a global indicator of the age structure of a population, increased by 1.5 years in Ontario, 2.9 years in Canada and 5.3 years in Quebec, leaving the three populations with very similar structures.

Since 1961, Canada, Quebec and Ontario have witnessed a decline in their 0-17 age group and an increase in their 18-64 age group as a proportion of their total population. The proportion of persons aged 65 years or over increased slightly in Ontario and Canada and more substantially in Quebec. The relative increase in the number of adults is primarily attributable to the significant decline in the birth rate in the 1960's and 1970's and to the coming of adult age of the numerous cohorts born prior to this phenomenon. This increase is also due to a lesser extent to migration. Canada's balance of migration for the years 1961 through 1980 was 1,179,200 persons, and Ontario's balance (including interprovincial migrants) was 989,200: since the migrants are most often young adults, they swell the ranks of the 18-64 age group. Quebec, on the other hand, had a negative balance of migration during this period (-286,800 persons): the departure of young adults ages the population.

Dependency Ratios

The various dependency ratios (for children, for the aged, and the total ratio) also serve as useful indicators since they provide information on the economic burden borne by the adult population. Between 1961 and 1980, the total dependency ratio in Canada declined from 0.871 to 0.622, or 29%. The Ontario and Quebec ratios declined by 25% and 34% respectively over the same period.

However, a breakdown of the total dependency ratio into ratios for children and the aged shows that the lightening of the economic burden borne by the adult population stems from a decline in the child dependency ratio, in spite of an increase in the aged dependency ratio. The widest variations were

Canada, le Québec et l'Ontario sont engagés dans un processus de vieillissement de la population par la base, caractérisé par une augmentation de la proportion des gens âgés, résultant de la diminution des effectifs de moins de 18 ans (exception faite d'une légère augmentation en Ontario) tel que l'illustre le tableau explicatif II.

Au 1^{er} juin 1980, il y a peu de différence entre les grands groupes d'âge du Canada, de l'Ontario et du Québec. La différence réside plutôt dans l'évolution des populations depuis 1961. L'âge médian, qui synthétise la structure par âge d'une population, a augmenté de 1961 à 1980 de 1.5 ans en Ontario, 2.9 ans au Canada et de 5.3 ans au Québec, pour conduire les trois populations à des structures très voisines.

Le Canada, le Québec et l'Ontario ont vu baisser depuis 1961 leur proportion de population âgée de 0-17 ans au profit des 18-64 ans. La proportion des gens âgés de 65 ans ou plus a légèrement augmenté en Ontario et au Canada, mais de façon plus sensible au Québec. L'augmentation relative des adultes est attribuable surtout à la forte dénatalité des années 60 et 70, et au passage aux âges adultes des générations nombreuses nées avant ce phénomène. Cet accroissement résulte également, dans une moindre part, des mouvements migratoires. Le solde migratoire canadien s'établissait de 1961 à 1980 à 1,179,200 personnes et le solde ontarien, incluant les migrants interprovinciaux, à 989,200: puisque les migrants sont plus souvent de jeunes adultes, ils gonflent les effectifs des 18-64 ans. Au contraire au Québec, le solde migratoire est négatif pour la même période, soit -286,800 personnes, conséquemment le départ de jeunes adultes vieillit la population.

Les rapports de dépendance

Les divers rapports de dépendance (celui des enfants, celui des personnes âgées, ainsi que le rapport global ou total) sont d'autres indices utiles à considérer puisqu'ils nous renseignent sur le fardeau économique que doivent supporter les adultes. Entre 1961 et 1980, le rapport global de dépendance est passé de 0.871 à 0.622 au Canada, soit une diminution de 29%. Durant la même période, ce rapport a diminué de 25% en Ontario et de 34% au Québec.

Toutefois, en décomposant le rapport global de dépendance en rapport de dépendance des enfants et en rapport des personnes âgées, on constate que l'allègement du fardeau économique des adultes résulte d'une baisse du rapport de dépendance des enfants, même s'il y a eu une hausse de celui des personnes âgées. C'est au Québec que les

recorded in Quebec: a 43% decline in the child dependency ratio since 1961 coupled with a 25% increase in the aged dependency ratio. The corresponding figures for Ontario are -32% and +7% respectively, while the Canada ratios fall in between those of the two provinces, although lying much closer to the Ontario ratios.

variations sont les plus fortes: une baisse du rapport des enfants de 43% depuis 1961, et une hausse du rapport des personnes âgées de 25%. En Ontario, les rapports de dépendance respectifs varient dans les proportions suivantes: -32% et +7%; le Canada quant à lui, constate des variations moyennes aux deux provinces mais se rapprochant beaucoup plus des rapports ontariens.

| Province | Total dependency ratio | | Child dependency ratio | | Aged dependency ratio | |
|----------|------------------------------|-------|-----------------------------------|-------|-------------------------------------------|-------|
| | Rapport global de dépendance | | Rapport de dépendance des enfants | | Rapport de dépendance des personnes âgées | |
| | 1961 | 1980 | 1961 | 1980 | 1961 | 1980 |
| Québec | 0.882 | 0.580 | 0.772 | 0.443 | 0.110 | 0.137 |
| Ontario | 1.810 | 0.610 | 0.663 | 0.452 | 0.147 | 0.158 |
| Canada | 0.871 | 0.622 | 0.728 | 0.467 | 0.143 | 0.155 |

Quality of Estimates

The postcensal estimates contained in this publication have a certain margin of inaccuracy deriving both from the margin of error for 1976 Census data, which are used as the basis for the present postcensal estimates, and from errors due to the methods of estimating the components.

Among the errors which may originate with census data are coverage errors and response and processing errors. Coverage errors are caused primarily by undercoverage, since overcoverage is so rare as to be considered negligible. For Canada as a whole, the overall undercoverage rate for the 1976 Census was approximately 2%. The rate varies not only from one province to another but also by sex and age as shown in Text Table III.

The main response and processing errors stem from non-responses, misinterpretation of questions by the respondents and coding and imputation errors. The response rate for the 1976 Census question on age was 98.4% and on sex 98.6%. For further details on the total standard error associated with the 1976 Census figures, the publication Catalogue 92-823 may be consulted.

Qualité des estimations

Les estimations postcensitaires contenues dans la présente publication sont entachées d'une certaine marge d'imprécision qui provient à la fois des marges d'erreur des données du recensement de 1976, population de départ des présentes estimations postcensitaires et des erreurs dues aux méthodologies d'estimation des composantes.

Parmi les erreurs imputables aux données du recensement, on retrouve les erreurs de couverture et les erreurs de réponse et d'exploitation. Les erreurs de couverture sont principalement causées par le sous-dénombrement. Le surdénombrement étant assez rare, il est considéré comme négligeable. Au niveau du Canada, le taux global de sous-dénombrement lors du recensement de 1976 fut d'environ 2%. L'importance du taux varie non seulement d'une province à l'autre mais aussi selon le sexe et l'âge tel qu'indiqué au tableau explicatif III.

Les principales erreurs de réponse et d'exploitation proviennent des non-réponses, des interprétations erronées de la part des recensés, du codage et de l'imputation. Les taux de réponse aux questions du recensement de 1976 ont été de 98.4% pour l'âge et de 98.6% pour le sexe. Pour plus de détails sur l'erreur type totale des chiffres du recensement de 1976, on peut se référer à la publication n° 92-823 au catalogue.

(1) This estimate has a very large standard error in relation to its size.

(1) Par rapport à sa taille, l'estimation a une très grande erreur-type.

Source: 1976 Census of Canada, Quality of Data, Series 1: Sources of Error-Coverage, Catalogue 99-840, page 31, Statistics Canada, Ottawa, March 1980.

Source: Recensement du Canada de 1976, Qualité des données, série 1: Sources d'erreurs-couverture, n° 99-840 au catalogue, page 31, Statistique Canada, Ottawa, mars 1980.

Unfortunately, little accurate information is available on the magnitude of error resulting from estimates of the components of population change. However, on the basis of the quality of the data sources, the components can be divided into two categories: the first consists of births, deaths and immigration,(1) for which the sources can be considered nearly perfect where final data is used, and the second is international emigration and interprovincial migration, for which the method used to estimate the number of emigrants and interprovincial migrants by sex and age may increase the risk of error.

On dispose malheureusement de peu d'informations précises sur l'importance de l'erreur provenant de l'estimation des composantes du mouvement de la population. Cependant, concernant la qualité de leurs sources de données, les composantes peuvent être divisées en deux catégories. Tout d'abord les naissances, les décès et l'immigration(1) pour lesquelles les sources peuvent être considérées comme presque parfaites lorsqu'il s'agit de données finales et, ensuite l'émigration internationale et la migration interprovinciale pour lesquelles les méthodologies utilisées pour estimer les effectifs d'émigrants et de migrants interprovinciaux selon le sexe et l'âge, peuvent accroître les risques d'erreur.

(1) This refers only to Canada's data on legal immigration, which excludes illegal immigrants and all former residents returning to the country after absences of 12 months or more.

(1) Il s'agit de l'immigration légale: sont donc exclus les immigrants illégaux et les anciens résidents canadiens revenant au pays après un séjour de 12 mois et plus à l'étranger.

Despite this, given the size of the errors observed at the end of the 1971-1976 intercensal period (see Text Table IV), the present postcensal estimates should have an acceptable degree of reliability, if it is assumed that the quality of the basic data remains constant. The reader should be cautious in interpreting these results, as the undercoverage varies from one age group to another and from one census to another. For example, at 15-19 years in 1971 the undercoverage rate was 2.71%. In 1976, these persons were 20-24 years of age, and their undercoverage rate reached 5.99%.

Si, par hypothèse, la qualité des données de base demeure inchangée, les présentes estimations postcensitaires devraient avoir un niveau de fiabilité acceptable, compte tenu des erreurs observées à la fin de la période intercensitaire 1971-1976, du moins au niveau du Canada (voir le tableau explicatif IV). Le lecteur devrait être prudent dans l'interprétation de ces résultats car le sous-dénombrement varie d'un groupe d'âges à l'autre et d'un recensement à l'autre. Par exemple chez les 15-19 ans en 1971, le taux de sous-dénombrement était de 2.71%. En 1976 ces personnes étaient âgées de 20 à 24 ans et leur taux de sous-dénombrement atteignait 5.99%.

- (1) Il s'agit d'une erreur pour une période de cinq ans.

$$\frac{\text{Population estimée} - \text{Population recensée}}{\text{Population recensée}} \times 100$$

DEFINITIONS

Population

"Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence...was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily". **Dictionary of the 1971 Census Terms**, Catalogue 12-540.

Census Year

The census year refers to the period beginning June 1 of a given year and ending May 31 of the following year. June 1 is Census Day.

Number of Complete Years Lived

Age at last birthday.

Birth Cohort

A group of persons born within a given 12-month period, the calendar year in general. Here, unless otherwise indicated, this period will exactly coincide with the census year.

June 1 Postcensal Population Estimate

For a given cohort, this is the estimate which is obtained by taking as a base the size of that cohort as of June 1 in the preceding year, and taking into account the demographic events which affected the cohort since that date.

Interprovincial Migration

Movements from one province to another involving a change in residence. A person who takes up residence in another province is an **out-migrant** with reference to his province of origin, and an **in-migrant** with reference to his province of destination.

DÉFINITIONS

Population

La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle...était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnées au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". **Dictionnaire des termes du recensement de 1971**, n° 12-540 au catalogue.

Année censitaire

Par référence à la date habituelle du recensement, on a convenu de désigner ainsi la période qui s'étend du 1^{er} juin d'une année au 31 mai suivant.

Âge en années révolues

Âge au dernier anniversaire.

Génération

Ensemble des personnes nées durant une même période de 12 mois, l'année civile en général. Sauf indication contraire, il s'agira ici des individus nés la même année censitaire.

Estimation postcensitaire de la population au 1^{er} juin

Pour une génération donnée, il s'agit de l'estimation obtenue en prenant comme base l'effectif de cette génération au 1^{er} juin de l'année précédente et en tenant compte des événements démographiques survenus depuis cette date.

Migration interprovinciale

Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement de résidence. Un individu qui effectue un tel déplacement sera un **sortant** pour sa province d'origine et un **entrant** pour sa province de destination.

Error of Closure

Difference between the population according to a census and the final postcensal estimate for the same date.

International Migration

Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between **immigrants** from other countries who settle in Canada and **emigrants** who leave Canada.

Undercoverage Rate

The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Median Age

An age x , such that exactly one half of the population is older than x and the other half is younger than x .

Sex Ratio or Masculinity Ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Dependency Ratio

Although the total population is usually sub-divided up into the following three broad age groups for children (ages 0-14), adults (ages 15-64), and aged persons (ages 65 and over), for purposes of calculating the various dependency ratios in this report the following age groups have been used: children (ages 0-17), adults (ages 18-64), and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

child dependency ratio, i.e., the number of children per adult;

aged dependency ratio, i.e., the number of aged persons per adult;

total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

A fourth ratio, the aged-to-child ratio, is sometimes used. It represents the number of aged persons per child.

Erreur en fin de période intercensitaire

Différence entre la population donnée par un recensement et l'estimation postcensitaire définitive à la date du recensement.

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement de résidence. On distingue à cet égard les **immigrants** qui viennent s'établir au Canada et les **émigrants** qui quittent le Canada.

Taux de sous-dénombrement

Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

Âge médian

Âge x tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à x , l'autre des individus d'âge inférieur à x .

Rapport de masculinité

Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

Rapport de dépendance

Bien qu'on a coutume de répartir la population en trois grands groupes d'âges: 0-14 ans (enfants), 15 à 64 (adultes) et 65 ans et plus (personnes âgées) pour calculer les divers rapports de dépendance, nous avons préféré utiliser les groupes d'âges suivants: 0 à 17 ans (enfants), 18 à 64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

le rapport de dépendance des enfants, égal au nombre d'enfants par adulte;

le rapport de dépendance des personnes âgées qui représente le nombre de personnes âgées par adulte;

le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Une autre mesure, le rapport personnes âgées-enfant, est parfois utilisée; elle renseigne sur le nombre de personnes âgées par enfant.

| Median age (years) - Âge médian (années): | | | | | | | | | | | | | |
| | 28.1 | 23.8 | 27.0 | 27.4 | 26.3 | 28.0 | 28.8 | 28.2 | 27.8 | 26.6 | 29.7 | 25.4 | 20.7 |

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

| | 29.5 | 24.3 | 28.5 | 28.9 | 27.5 | 29.8 | 30.4 | 29.8 | 28.8 | 27.1 | 30.6 | 24.6 | 20.6 |

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

| Median age (years) - Âge médian (années): | | | | | | | | | | | | | |
| | 28.8 | 24.1 | 27.7 | 28.2 | 26.9 | 28.9 | 29.6 | 29.0 | 28.3 | 26.8 | 30.1 | 25.0 | 20.7 |

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(D) : Final estimate.

(D) : Estimation définitive.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.

(P) : Preliminary estimate.

(P) : Estimation préliminaire.

-- : Less than fifty persons.

-- : Moins de cinquante personnes.
